West Virginia University Research Computing (WVU-RC) is a team inside WVU's Information Technology Services (ITS) dedicated to supporting, enabling and advancing computational research at WVU.

This site contains information about how to use the various technologies provided by the Research Computing division at West Virginia University. Most documentation here refers to our High Performance Computing clusters but we also provide a variety of other services a large storage service called DataDepot, a DMZ (demilitarized zone) for high speed data transfers called Research Exchange (REX) and support and training in areas of High Performance Computing, Data Analysis and Parallel Programming.

There are several websites associated with WVU-RC activities, here is a list of the most relevant ones:

**The official webpage in ITS portal about the Research Computing Division** [WVU Research Computing - ITS Website](#)

**The legacy documentation was a Wiki website continue to be online for a while** [WVU Research Computing - Legacy Wiki](#)

**The HelpDesk ticket system** [WVU Research Computing - HPC HelpDesk](#)

For requesting help, create a new ticket at the Research Computing HPC Help Desk web page. You are welcome to e-mail any member of the WVU-RC team directly, but since we are not always at our desk, the ticket system will guarantee that your support question will be seen by someone currently available.

## INTRODUCTION

Despite the fact that this documentation is mostly about our High Performance Computing (HPC) Clusters, West Virginia University Research Computing (WVU-RC) offers a variety of technologies and services beyond HPC, the *Introduction* chapter summarizes those services and the policies regarding its usage.

First time users should go to *Quick Start*. This chapter is presented as a tutorial where the basic elements of using a computer cluster are presented and guide the user step by step from getting an account to submit a job and take the results back to his/her own desktop computer.

Once you have followed the *Quick Start* we move into *For Basic Users*, this chapter assumes that user knows at least how to enter into the cluster and submit a basic job. The chapter provides basic information that was not covered in the *Quick Start* tutorial. We include more information about command line interface, the various text-based editors, environment modules and more details on the various elements that were skipped before.

The next chapter *For Advanced Users* is intended for users who feel comfortable with the Command Line Interface. Advanced users are supposed to know how to create scripts using Shell Scripting or any other interpreted language. Advanced users could want to install their own software, using containers, or Conda environments.

The chapter *For Developers* is intended for users with interest on using their own programs on the clusters. We introduce the basics of using compilers, build systems, parallel programming, debugging, profiling and optimization. A developers can be considered as an advanced user who program their own codes, or integrate other codes in more than a simple linear work flow.

The chapter *For Administrators* we make reference to the various tools that can be used to monitor the global health of the clusters. In general users does not need to have that global view, but knowing how the entire cluster works can give them insights about their own role in having an effective usage of the cluster.

The next chapter, *Domain Specific Details* collects sections for various packages that are relevant for a restrict number of researchers.

Chapter *Clusters Specifications* should serve as a reference about the current configuration of the clusters, in terms of hardware, software, modules, and queues.

The final chapter *References* is also referential, it is collects tables about Unix commands, PBS options, variables, it should be of good use when you know exactly what you are looking for.

### 1.1 Infrastructure and Services

We provide access to centrally managed computational systems, several High Performance Computing and data analysis clusters. We also offer Infrastructure that support researchers such as large and secure storage, high-speed data transfer channel using a demilitarized zone (DMZ), support in areas of High Performance Computing, Parallel programming and visualization and training on those areas via workshops and seminars.

Here we summarize the different dimensions of action for WVU-RC:

### 1.1.1 High-Performance Computing

We operate 2 High-Performance computing Clusters and one more has been acquired and should be deployed by the end of the year.

The High Performance Computing facilities are funded by the National Science Foundation EPSCoR Research Infrastructure Improvement Cooperative Agreement #1003907, the state of West Virginia (WVEPSCoR via the Higher Education Policy Commission), the WVU Research Corporation and faculty investments.

The two clusters in operation are called *Mountaineer* and *Spruce Knob*. The newest cluster, called *Thorny Flat* should be in operation by the end of 2018.

*Mountaineer* is WVU's oldest shared cluster and it is a 384 core Intel high-density computing cluster based on Xeon Westmere processors. Each node has 12 cores and 48GB of RAM, providing 4GB per node average. Storage is provided by a direct-attached SAN unit with 10TB of formatted disk space, as well as a network attached storage system with 60 TB of storage capacity. *Mountaineer* will stop operation when the new cluster *Thorny Flat* starts.

*Spruce Knob* is WVU's current HPC system. This system is 176 nodes, 3,376 core heterogeneous high-density computing cluster based on Intel Xeon Sandy Bridge, Ivy Bridge, Haswell, and Broadwell processors. *Spruce Knob* follows a condo model where faculty members can purchase direct access to nodes on the cluster making them part owners of the cluster.

*Thorny Flat* will be the next generation HPC cluster, with around 111 nodes, more than 4000 cores and a number of Nvidia P6000 GPU cards for extra computing power.

### 1.1.2 Data Analysis Cluster

*GoFirst* Cluster is a dedicated WVU MS Business Data Analytics computing resource that allows students in the Business Data Analytics M.S. program to gain experience in a controlled, secure cloud-computing environment. *GoFirst* is build from four compute nodes running HDFS shared filesystem, to run Hadoop and Spark jobs using RStudio as a frontend interface.

### 1.1.3 Research Exchange

REX is a Science DMZ, or demilitarized zone, which is a dedicated “express lane” network for research data traffic within the University's larger network. It is funded through a nearly \$487,000 cyber infrastructure grant that WVU Research Corp. won in 2014 year from the National Science Foundation.

REX gives Information Technology Services the ability to separate research traffic from other Internet traffic, guarantee high-speed Internet2 access for WVU researchers, and facilitate data exchanges with off-campus collaborators. The upgrades also provide WVU researchers with greater access to off-campus resources such as national scientific super-computing centers. The grant funded the development and deployment of two Data Transfer Nodes, high-performance data transfer “depots” that will improve the ability to move large science data sets. These Data Transfer Nodes have 640TB of raw disk storage, giving researchers a high-speed storage location when transferring large data sets.

### 1.1.4 HPC storage

WVU-RC offers researchers access to two tiers of storage through our Data Direct Network GRIDScaler system. Our standard tier of storage is available free to all users, but users also have the option to purchase dedicated group storage on the system.

The GRIDScaler system provides access to high-speed parallel GPFS storage and currently provides over 7 GB of throughput and 1 PB of raw storage.

All users of HPC systems have access to more than 400 TB of high-speed scratch storage. Scratch storage is for temporary storage of files and gives researchers a place to process large amounts of data. In addition, each user is provided 10 GB of home directory space and 10 GB of group storage space upon request.

Some researchers prefer to have dedicated group storage on the HPC cluster to store large amounts of data for processing without the fear of it being removed. These researchers can purchase dedicated storage for their group at \$189/TB per year. This also offers an easy way to share data between researchers in the same group.

### **1.1.5 Data Depot**

The WVU Research Data Depot is a centrally managed, reliable, secure and fast data storage system specifically designed to meet the university's diverse research storage needs. Designed to handle all size of files, from small to very large, researchers who use this service will have access to their data both on and off campus and can also use it to collaborate with researchers outside of WVU.

ITS designed the Data Depot to be easy to use. Researchers have access to drag and drop files through an interface they are accustomed to using such as Windows, OSX or Linux file managers. Command line tools, such as sftp, and Linux based command, such as mount, can also be used to access the files on lab PCs/servers.

More information on: [Research Data Depot](#)

### **1.1.6 Seminars and workshops**

WVU-RC supports the mission of educate users on High Performance Computing, Parallel Programming and Data Analysis via seminars and workshops.

## **1.2 Getting Help**

To request the opening of an account, software installation, general support on HPC, DataDepot and most of our services please open a ticket on

[WVU Research Computing - HPC HelpDesk](#)

 [Support Center Home](#)

 [Open a New Ticket](#)

 [Check Ticket Status](#)

## Welcome to WVU's HPC Support Center

In order to streamline support requests and better serve you, we utilize a support ticket system. Every support request is assigned a unique ticket number which you can use to track the progress and responses online. For your reference we provide complete archives and history of all your support requests. A valid email address is required to submit a ticket.

### Open a New Ticket

Please provide as much detail as possible so we can best assist you. To update a previously submitted ticket, please login.

[Open a New Ticket](#)

### Check Ticket Status

We provide archives and history of all your current and past support requests complete with responses.

[Check Ticket Status](#)

Click *Open a New Ticket* and fill mandatory fields marked with a red \*

 Support Center Home  Open a New Ticket  Check Ticket Status

## Open a New Ticket

Please fill in the form below to open a new ticket.

Help Topic: — Select a Help Topic — \*

---

### Contact Information

Email Address:  \*

Full Name:  \*

Phone Number:  Ext:

---

### Ticket Details

*Please Describe Your Issue*

Issue Summary:  \*

Issue Details:

<> ¶ B I U ↺ ☰ ☷ ⌵ ⌶ 🖼️ ▶ 📅 🔗 ⌵ —

Details on the reason(s) for opening the ticket. If requesting new account simply state "New Account Request". If placing order simply state "New Order".

📎 Drop files here or [choose them](#)

\* CAPTCHA Text:   Enter the text shown on the image. \*

Once all relevant information is provided, click on *Create Ticket* and your request will be submitted to the WVU-RC for processing.

## 1.3 Policies

### 1.3.1 Running Jobs on Login Node

Running jobs/tasks on the login node is not permitted. When the RC admin team notices this occurring, the processes will be killed immediately to ensure system stability. If you are having trouble submitting jobs through the scheduler, please follow instructions on [Getting Help](#) and we would be happy to help.

### 1.3.2 Data storage

Current storage limits are specific to each cluster and directories (Home and Scratch). For information about where these directories are located and storage quotas please visit the [Disk Storage](#) page.

### 1.3.3 Sharing User Directories

Initially sharing user directories or scratch space is not permitted. This is for tracking user purposes. However, we recognize that research is collaborative in nature, and therefore we are attentive for request for sharing resources across user spaces for temporary or fixed time limits to get jobs completed. Please follow instructions on [Getting Help](#) and the WVU-RC team with these requests.

Users also have the option of using group storage for sharing of files. A Principal Investigator (PI) may request up to 10 GB of group storage for free. Additional storage may be purchased if desired. For more information, please visit [Persistent Group Storage](#).

### 1.3.4 Getting Software Installed On the Cluster

Software needed on the cluster for research work can be installed at user requests. However, we initially recommend that software, scripts, and programming libraries be installed locally in user directories as opposed to system-wide. This is generally because system-wide installs of software/libraries not supported directly by Red Hat Enterprise Linux (RHEL) may get broken during system-wide updates. If the software/library has a large enough appeals (multiple users/multiple research teams) we can and will assist in installing a system-wide version. If assistance is needed for installing software/libraries locally in your user directory please follow instructions at [Getting Help](#), the WVU-RC team we will gladly assist.

### 1.3.5 User Priority for Job Submission

Depending on what hostname your submitting jobs on, different priority defaults are assigned to your job submission. On Mountaineer priority for queues are set by fair share queueing. This means that user priority is assigned based on a combination of the size of the job and how much system resources you have used during the given week, with higher priority assigned to larger jobs and/or user jobs that have used less system resources in the week. On Spruce knob, the research team nodes are first come first serve priority, with jobs submitted before other jobs having higher priority. For specifications associated with the standby queue and community node queues on Spruce Knob, please see the [Spruce Knob Queue](#) page. If you would like to have different priority settings for your research teams queue please follow instructions at [Getting Help](#) for the WVU-RC team attend your request.

### 1.3.6 Database Management on Clusters

The current set-up for the HPC clusters is for common HPC use. This means that the compute nodes where set-up with the idea that data will be transferred to the system, computed, and then transferred off. Database management

systems are not currently supported on the cluster because the compute nodes were never initially set-up to handle the data storage required. However, if your research team has a need for Managed Database systems that have large storage needs with a database management system back-end (i.e. MySQL, Oracle, etc) please [Getting Help](#) the RC HPC team and we can come up with solutions to handle these data requests.

### 1.3.7 X11 Forwarding - Running visualization software

Non compute intensive processes for visualization purposes can be run on the login node. These processes include “could” gnuplot, R and Matlab. However, if your visualization job requires computing data before producing graphs and figures, it is best to run these jobs through the scheduler in batch mode. Compute intensive jobs, visualization or not, are not permitted to run on the head-node. If you have any questions about the best way to accomplish your computing goal, please follow instructions on [Getting Help](#) through the help desk and we will provide any assistance needed to fulfill your requirements.

## QUICK START

This is a short tutorial intended for first-time users. We assume no familiarity with High Performance Computing (HPC). The only requirement is basic familiarity with your own computer in order to install the SSH client needed to connect to the cluster.

We start on *Getting Access* on how to request and account. Once the access is granted, we proceed to *Connect to the cluster* to install and use a SSH client that allow you to get a terminal on the HPC cluster. A Terminal and its command line interface can be the first barrier for an user only familiarized with Graphical User Interfaces (GUI), on *Command Line Interface* we present the most basic commands that will help you to create and manipulate folders and files. The next step is to learn how to edit files, on *Editing Files* we show how to use `nano` a very simple but effective text editor. We will use it to create the first program in FORTRAN that we will use later to explain execution on a batch system. The next section, *Storage*, explains the several options to store data on the cluster, this is very important for first time users as they have the tendency to rely only on the `$HOME` folder a storage space that is very limited in most scientific purposes. At this point we are ready to submit our first job. The section *Job Submission* shows how to write a submission script and submit the job to the queue system. Finally, section *Transferring Files* explains how to move files in and out between the HPC cluster and your own computer.

At the end of this tutorial, you should have your account activated, connected to spruce, able to create files and folders, submitting simple jobs to the queue system and taking the data back to your own machine.

## 2.1 Getting Access

A High-Performance Computing (HPC) cluster is a research infrastructure intended to be used by multiple users simultaneously in order to execute calculations that are beyond the capabilities of current personal computers and workstations.

There are two steps involve in getting access to our HPC clusters, having a *WVU account* and using that *WVU account* to get a *HPC account*.

### 2.1.1 WVU Login Account

To gain access to WVU's Research Computing systems (including HPC systems), users need to first have a *WVU Login Account*.

You can request a *WVU login account* for someone from outside the WVU community in order for the person to have access to specific online resources here. You will need the person's legal name, birth date and current email address in order to make the request, which can be accomplished by filling out the Special Account Request form. Click the **LOGIN Account Ticket** button to get started.

Any employee may submit a request on behalf of a colleague elsewhere and there is no charge to request or use this service.

If you need a WVU Login account, please make a request with [Service Desk](#).

Click on **LOGIN Account Ticket** and follow instructions.

## 2.1.2 HPC Account

After getting a *WVU Login Account*, you will need to request access to Research Computing systems through the [Research Computing Help Desk](#) web page by clicking on the ‘Open a new ticket’ button and selecting ‘New User Account Request’ under help topic. More information on [Getting Help](#)

On *Help Topic* select *New User Account Request* Enter your personal information such as Full Name and WVU’s email address. Personal email addresses (MSN, Gmail, etc) are not allowed for WVU users, for external users, its advisable for them to use an institutional account instead of a personal one.

Enter the field for *Principal Investigator (PI)*, he or her will be the person to be contacted in order to get your account accepted.

For accounting purposes is very important that you fill a *Project Title* and a fairly complete *Project Abstract* This information is collected in order to prepare usage reports for financing institutions.

HPC users must ensure data that is covered by Federal security or privacy laws (e.g., HIPAA, ITAR, FERPA, classified information, etc.) is not stored on any WVU HPC system (Mountaineer or Spruce Knob). These systems currently do not meet the enhanced security requirements imposed or implied by those laws or regulations. By selecting the check mark you are acknowledging you will not store ANY protected data on WVU’s HPC systems.

Please acknowledge use of these supercomputing systems (Mountaineer and/or Spruce Knob) at WVU, which are funded in part by the National Science Foundation EPSCoR Research Infrastructure Improvement Cooperative Agreement #1003907, the state of West Virginia (WVEPSCoR via the Higher Education Policy Commission) and WVU, in your publications produced using these resources.

Once the the ticket is submitted a the PI will be notified for acceptance and your *HPC account* will be created. You will be notified once the account is ready for usage.

For any additional questions regarding access, please email us at [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu).

## 2.2 Connect to the cluster

A HPC cluster is a big computing infrastructure intended for concurrent usage by many users. A desktop, laptop or even workstations are intended for a single user at a time. In general Graphical User Interfaces consume important amount of resources even when the user is not making use of them, that is one of the reasons why is common practice in HPC clusters to only allow remote shell access and limited capabilities for GUI applications.

Due to security reasons, HPC clusters are intended to be accesed using a secure shell, the standard secure shell nowadays is called SSH. Secure Shell (SSH) is a cryptographic network protocol for operating network services securely over an unsecured network such as internet. The typical application of SSH in HPC is to provide remote command-line login and remote command execution.

SSH was created as replacement to Telnet and old method for remote communication with no capability of encryption. This kind of access have been disabled and will not work on any cluster.

In other to connect to any of our clusters you need a *username*, your name as user of the cluster. You should have obtained that *username* with your *WVU Login account* The next step is to use a SSH client to connect to one of our clusters.

## 2.2.1 Get a SSH Client

An SSH Client is a piece of software that allow you to run a remote session on a computer, over a network using a secure connection based on the SSH protocol.

A SSH client is usually installed on MacOS and most Unix/Linux distributions so if you are using one of those Operating Systems you do not need to install anything.

Windows users will have to acquire an SSH client. PuTTY is a free implementation of SSH for Windows platforms, it comes along with an xterm terminal emulator.

Go to [PuTTY](#) to know more about the product or download it directly from [PuTTY Download](#).

PuTTY is not the only SSH client available for Windows. See for example [Comparison of SSH clients](#) for several alternatives.

## 2.2.2 Connecting to a cluster via SSH

On MacOS and Unix/Linux, open a terminal shell and type:

```
$> ssh <username>@<hostname>
```

or:

```
$> ssh -Y <username>@<hostname>
```

Where <username> is your *WVU Login account* username and <hostname> is the name of the cluster you wish to connect to. The -Y option is used to forward X windows applications running on the server to be forwarded to your local machine. Remember that the \$> symbols above are there to indicate a command on the terminal, you should not enter those initial characters.

We currently have two clusters *Mountaineer* and *Spruce Knob* the hostnames are:

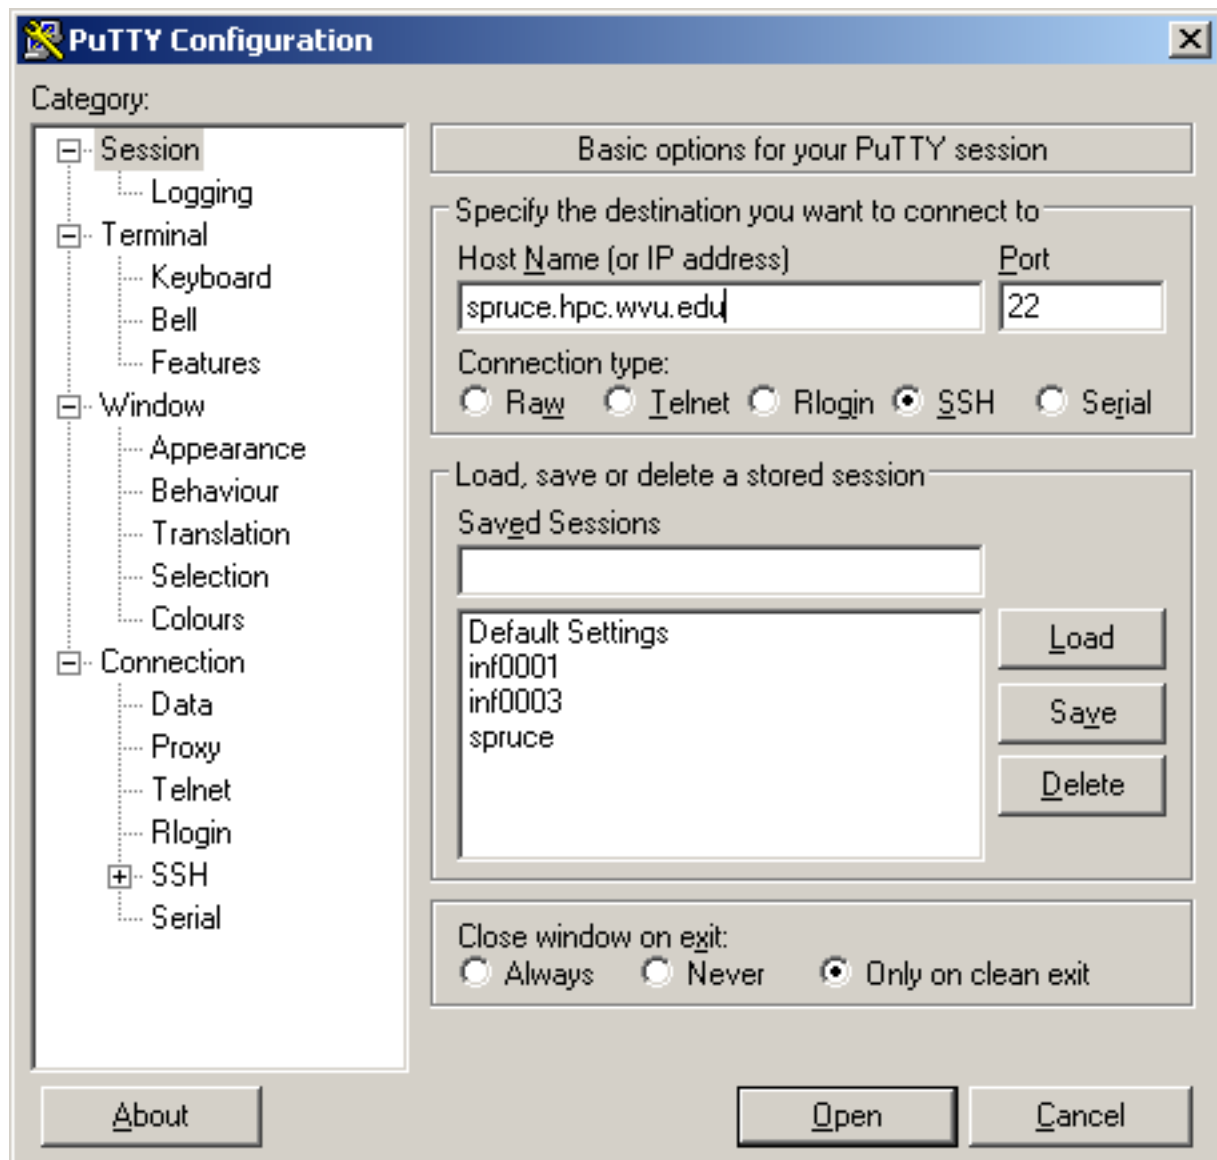

Table 2.1: WVU's High Performance Computer (HPC) Clusters

Cluster	Hostname	Status
<b>Mountaineer</b>	<i>mountaineer.hpc.wvu.edu</i>	To be decommissioned by the end of 2018
<b>Spruce Knob</b>	<i>spruce.hpc.wvu.edu</i>	Operational
<b>Thorny Flat</b>	<i>thorny.hpc.wvu.edu</i>	To be deployed by the end of 2018

If you want to connect to Spruce use the following command:

```
$ ssh <username>@spruce.hpc.wvu.edu
```

If you are using Windows and PuTTY, click on PuTTY Icon and enter the hostname

If you want to get X11 forwarding, ie remote windows popping on your local machine, enable X11 forwarding as shown below.

### 2.2.3 Logging In

When your SSH access is granted, you will be prompted with a login message (below is the Spruce Knob login message):

```
$> ssh <username>@spruce.hpc.wvu.edu
```

```
-----
                Welcome to the Spruce Knob Supercomputer
        Shared Research Facilities, West Virginia University
        -----
```

```
                ** Unauthorized use/access is prohibited. **
```

The actual or attempted unauthorized access, use, or modification of this system is strictly prohibited. Unauthorized users may be subject to institutional disciplinary proceedings and/or criminal and civil penalties under state, federal, or other applicable domestic and foreign laws. The use of this system is monitored and recorded for administrative and security reasons. Anyone accessing this system expressly consents to such monitoring and is advised that if monitoring reveals possible evidence of criminal activity, the Institution may provide the evidence of such activity to law enforcement officials.

In addition, users must ensure data that is protected by Federal security or privacy laws (e.g., HIPAA, ITAR, FERPA, classified information, etc.) is not stored on this system. This system is not intended to meet the enhanced security required by those laws or regulations.

By logging on to this system, you acknowledge your awareness of and acceptance of with WVU's Acceptable Use Policies and you agree not to store any of the before mentioned protected data.

WVU Acceptable Use of Data and Technology Resources Policies:

<http://it.wvu.edu/governance/standards-and-procedures/all-standards/au>

-----  
Password:

Following this message, you will be prompted for your password. Type in your password and you will be given a command prompt. If you are out of WVU network you will be asked to provide Two-Factor Authentication. You can know more about this on [Two-Factor Authentication \(Duo\) Articles](#)

Once your identity is confirmed the login procedure will resume:

Last login: Thu Nov 1 09:23:22 2018 from 157.182.62.87

---

Questions and Problem Reports:

- Email: [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu)
- Help Desk Ticket System: <https://helpdesk.hpc.wvu.edu>

Additional information on Spruce Knob:

- Documentation: <http://wiki.hpc.wvu.edu>
  - HPC Website: <http://sharedresearchfacilities.wvu.edu/facilities/hpc>
- 

Further system related information:

- Spruce Knob utilizes the TORQUE/PBS resource manager to manage compute resources.

To run an interactive shell, issue:

`qsub -I -q queue_name`

To submit a batch job, issue: `qsub job_script.sh`

To show all queued jobs, issue: `showq` or `qstat`

To check a job status: `checkjob <jobId>`

To kill a queued job, issue: `canceljob <jobId>`

Example PBS job scripts are located at:

[http://wiki.hpc.wvu.edu/hpc\\_wiki/index.php/Sample\\_Job\\_Scripts](http://wiki.hpc.wvu.edu/hpc_wiki/index.php/Sample_Job_Scripts)

The following man pages provide helpful pbs information:

`man pbs_resources_linux` (How-to request cluster resources)  
`man qsub`  
`man qstat`

- Spruce Knob utilizes Environment Modules to help manage different software packages available on the cluster. "module avail" shows the available modules.
- Spruce has two file systems available to users:
  - \$HOME (permanent storage that is backed up via snapshots, 10GB Limit)
  - \$SCRATCH (temporary storage that is NOT backed up, current allocation 130 TB)
- Please acknowledge use of this Super Computing System (Spruce Knob) at WVU, which are funded in part by the National Science Foundation EPSCoR Research Infrastructure Improvement Cooperative Agreement #1003907, the

state of West Virginia (WVEPSCoR via the Higher Education Policy Commission) and WVU, in your publications produced using these resources.

---

Recent Updates:

- 2018.05.18 - Completed OS and server updates across entire system.

At this point you will get a terminal prompt such as:

```
<username>@srih0001:~$
```

All the commands executed from now on are happening on a remote machine, the Spruce Knob *head node*, this is the place where most of your direct interaction with the cluster happens.

## 2.2.4 Logging Out

Logging out of a cluster can be done with the exit command:

```
$> exit
```

The exit command will attempt to terminate any process running on the head. In some cases, you will get an error that jobs are either currently running or currently stopped. You can view stopped jobs using the jobs command:

```
$> jobs -l
[1]+ 3325 Stopped                  vim script56.py
```

The output of jobs -l will give you the job PID number (in this case 3325) and the command (vim script56.py). To kill jobs preventing successful logout, use the kill command:

```
$> kill -s 9 3325
```

Once all jobs are terminated, the exit command will close the connection to host. On section [Job Submission](#) we will explain how to submit jobs on the queue system. Jobs on the queue system are not killed when you log out of the head node.

## 2.3 Command Line Interface

The interaction with a HPC cluster happens most of the time using a Command Line Interface (CLI). One the cluster all your interaction is controlled by a program called a *shell*. You identify that you are in *shell* when you see what is called a *prompt*, a set of characters that indicate that the *shell* is ready to receive instructions to operate.

To issue a command to the shell you type a command, eventually followed for a few arguments. When you end typing the full command you type the ENTER key, the command is executed and if the command is programmed to produce screen output it will appear on your terminal as it executes. Once the command is terminated you get a new *prompt* indicating that the shell is ready for new commands.

The CLI interface is a powerful way to interact with a remote computer.

1. It takes little resources on the remote machine allowing the machine to serve tens, hundreds and in some cases even thousands of concurrent users.
2. The *shell* is far more than command reader and executioner, it is actually a complete programming language. You can create complex sets of instructions by doing what is called *Shell Programming* actually the ability to do shell programming is what we use in this document to differentiate a basic user from an advanced user.

3. Despite of the learning curve being steeper, the CLI give you far more control on the machine, so as you become more comfortable using it you will be able to do things than on a Graphical User Interface are simply cumbersome.

Using a CLI is probably the biggest obstacle than beginners has to overcome before start taking advantage of a HPC cluster. Here we will offer a short straight to the point introduction to the bare minimal of managing files and folders on the *shell*.

### 2.3.1 Files and Folders

Operating Systems from UNIX legacy, Linux and MacOS being the most prominent examples, uses the idea of *folders* and *files* to organize the data on their storage device. Differently from Windows, on UNIX there is not such idea of Drives C : or D : or letters for CD Drives or USB Keys. In UNIX every piece of data on any storage device is logically located in some place of a *filesystem tree*. Thing about the *filesystem tree* where the lowest level is called *the root folder* and is indicated by /. From / you will see branches like /bin, /lib and many others, those are folders. Inside each folder there are potentially more folders and files. The tree structure as a metaphor for storing data is very powerful and in the case of UNIX system that data structure is deeply exploited in UNIX systems, even hardware devices such as sound outputs, hard drives receive a file-like entry on the rooted tree. When you insert a USB drive, Modern Linux distributions and MacOS will *mount* it automatically, meaning that it will receive a location on the tree, in the case of Linux, the mounting point is usually somewhere inside /*media*/, in MacOS the mounting point is /*Volumes*.

In the particular case of your interaction with the HPC cluster there are two important folders that you should be aware of. They are so important that they receive special variables to tell you what they are.

### 2.3.2 The *echo* and *cat* commands

Your first command will show you what those locations are. Execute:

```
$> echo $HOME
/users/<username>
$> echo $SCRATCH
/scratch/<username>
```

The first command to learn is *echo*. The command above uses *echo* to show the contents of two shell variables *\$HOME* and *\$SCRATCH*. Shell variables are ways to store information in such a way that the shell can use it when needed. Each user on the cluster receives appropriated values for those variables.

Lets explore a bit more the usage of *echo*. Enter this command line and execute ENTER:

```
$> echo "I am learning UNIX Commands"
I am learning UNIX Commands
```

The shell is actually able to do basic arithmetical operations, execute this command:

```
$> echo $((23+45*2))
113
```

Notice that as customary in mathematics products take precedence over addition. That is called the PEMDAS order of operations, ie “Parentheses, Exponents, Multiplication and Division, and Addition and Subtraction”. Check your understanding of the PEMDAS rule with this command:

```
$> echo $(((1+2**3*(4+5)-7)/2+9))
42
```

Notice that the exponential operation is expressed with the *\*\** operator. The usage of *echo* is important, otherwise, if you execute the command without *echo* the shell will do the operation and will try to execute a command called 42 that does not exists on the system. Try by yourself:

```
$> $ $((1+2*3*(4+5)-7)/2+9)
-bash: 42: command not found
```

As you have seen before, when you execute a command on the terminal in most cases you see the output printed on the screen. The next thing to learn is how to redirect the output of a command into a file. This will be very important later to submit jobs and control where and how the output is produced. Execute the following command:

```
$> echo "I am learning UNIX Commands" > report.log
```

With the character `>` redirects the output from `echo` into a file called *report.log*. No output is printed on the screen. If the file does not exist it will be created. If the file exists previously, the file is erased and only the new contents are stored.

To check that the file actually contains the line produced by `echo`, execute:

```
$> cat report.log
I am learning UNIX Commands
```

The `cat` (concatenate) command displays the contents of one or several files. In the case of multiple files the files are printed in the order they are described in the command line, concatenating the output so the name of the command.

You can even use a nice trick to write small text on a file. Execute the following command, followed by the text that you want to write, at the end execute `Ctrl-D` (`^D`), the *Control Key* followed by the `D` key. I am annotating below the location where `^D` should be executed:

```
$> cat > report.log
I am learning UNIX Commands^D
$> cat report.log
I am learning UNIX Commands
```

In fact there are hundreds of commands, most of them with a variety of options that change the behavior of the original command. You can feel bewildered at first by the large number of existing commands, but in fact most of the time you will be using a very little number of them. Learning those will speed up your learning curve.

### 2.3.3 Folder commands

As we mention before, UNIX organizes data in storage devices as a tree. The commands `pwd`, `cd` and `mkdir` will allow you to know where you are, move your location on the tree and create new folders. Later we will see how to move folders from one location on the tree to another.

The first command is `pwd`. Just execute the command on the terminal:

```
$> $ pwd
/users/<username>
```

It is very important at all times to know where in the tree you are. Doing research usually involves dealing with important amount of data, exploring several parameters or physical conditions. Organize properly all the data in meaningful folders is very important to research endeavors.

When you log into a cluster, by default you are located on your `$HOME` folder. That is why most likely the command `pwd` will return that location in a first instance.

The next command is `cd`. This command is used to *change directory*. Directory is another name for *folder*. The term *directory* is also widely used. At least in UNIX the terms *directory* and *folder* are exchangeable. Other Desktop Operating Systems like Windows and MacOS have the concept of *smart folders* or *virtual folders*, where the *folder* that you see on screen has not correlation with a directory in the filesystem. In those cases the distinction is relevant.

There is another important folder defined in our clusters, its called the scratch folder and each user has its own. The location of the folder is stored in the variable `$SCRATCH`. Notice that this is an internal convection and is not observed in other HPC clusters.

Use the next command to go to that folder:

```
$> cd $SCRATCH
$> pwd
/scratch/<username>
```

Notice that the location is different now, if you are using this account for the first time you will not have files on this folder. It is time to learn another command to list the contents of a *folder*, execute:

```
$> ls
$>
```

Assuming that you are using your HPC account for the first time, you will not have anything on your `$SCRATCH` folder. This is a good opportunity to start creating one folder there and change your location inside, execute:

```
$> mkdir test_folder
$> cd test_folder
```

We have use two new commands here, `mkdir` allow you to create folders in places where you are authorized to do so. For example your `$HOME` and `$SCRATCH` folders. Try this command:

```
$> mkdir /test_folder
mkdir: cannot create directory `/test_folder': Permission denied
```

There is an important difference between `test_folder` and `/test_folder`. The former is a location in your current working directory (CWD), the later is a location starting on the root directory `/`. A normal user has no rights to create folders on that directory so `mkdir` will fail and a error message will be shown on your screen.

The name of the folder is `test_folder`, notice the underscore between *test* and *folder*. In UNIX, there is no restriction having files or directories with spaces but using them become a nuisance on the command line. If you want to create the folder with spaces from the command line, here are the options:

```
$> mkdir "test folder with spaces"
$> mkdir another\ test\ folder\ with\ spaces
```

In any case you have to type extra characters to prevent the command line application of consider those spaces as separators for several arguments in your command. Try executing the following:

```
$> mkdir another folder with spaces
$> ls
another  another folder with spaces  folder  spaces  test_folder  test folder with spaces  with
```

Maybe is not clear what is happening here. There is an option for `ls` that present the contents of a directory:

```
$>ls -l
total 0
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:44 another
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:45 another folder with spaces
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:44 folder
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:44 spaces
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:45 test_folder
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:45 test folder with spaces
drwxr-xr-x 2 myname mygroup 512 Nov  2 15:44 with
```

It should be clear, now what happens when the spaces are not contained in quotes `"test folder with spaces"` or escaped as `another\ folder\ with\ spaces`. This is the perfect opportunity to learn how to delete empty folders. Execute:

```
$> rmdir another
$> rmdir folder spaces with
```

You can delete one or several folders, but all those folders must be empty. If those folders contain files or more folders, the command will fail and error message will be displayed.

## 2.4 Editing Files

Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.

## 2.5 Storage

### 2.5.1 Home Directory

Home directories on Spruce Knob are located in /users directory and is the default login location for users. The default disk quota for each user is 10 Gb. As such, we recommend that home directories use should be primarily to store scripts, binary executables and other small data file types. For research data, users should use Spruce Knobs Scratch space.

This data is backed up on a daily basis via snapshots and tape. Users can retrieve up to 4 weeks of older files from /users/snapshots/{date}/\$USER if needed. If files are not available in the snapshot, please contact [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu) and the HPC team will attempt to retrieve the data from tape.

Note: Users may check their storage quota via the following command:

```
quota
```

### 2.5.2 Scratch Directory

Scratch directories are located in /scratch directory, and can be easily moved to using the \$SCRATCH environment variable set-up by default for each user.

```
cd $SCRATCH
```

Scratch directories on Spruce Knob are treated as true scratch space: There is no user defined quota for space. All users scratch directories share the same file space, which is set at 130 Tb. When the scratch directory becomes full, files are automatically deleted by date. To facilitate this, all users should use their scratch space as true temporary storage. However, we will notify users well in advanced for schedule file deletions to give users ample time to remove data to prevent data loss.

**Note: Scratch data is NOT backed up.**

### 2.5.3 Persistent Group Storage

Research groups may purchase long term persistent storage from the RC HPC. This storage allows users to keep data on the cluster that will not be removed. In addition, this storage utilizes the same GPFS file system so files can be written directly to this storage from jobs executing on the cluster.

Persistent storage must be purchased in 1 TB chunks. To purchase this storage, go to <https://helpdesk.hpc.wvu.edu>, select “Open a New Ticket”, and select “Dedicated Storage Order” from Help Topic. For more information, please contact [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu).

For groups who have purchased this storage, it can be accessed here:

```
cd /group/{group_name}
```

**Note: Persistent group storage is NOT backed up.**

**Note: Persistent Group storage has been replaced by a the new ‘Research Data Depot Service <<https://wvu.teamdynamix.com/TDClient/KB/ArticleDet?ID=35328>>’.**

## 2.5.4 Archival Storage

Please see the [Research Data Depot Service](#) for archival storage options.

For additional information please contact [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu).

## 2.6 Job Submission

Shared resources like Computer clusters are intended to be used by several people at the same time. To coordinate usage of the resources, users should request to a system called “Resource Manager” to give them access to some resources for a predefined amount of time.

The set of resources that are requested and the set of commands that you plan to execute is called a job. There are two kinds of jobs: “interactive” and “non-interactive”

## 2.7 Transferring Files

### 2.7.1 Data Transfer Nodes

The HPC facility has two servers dedicated for transferring files around WVU as well with other locations around the globe. These two servers are called Data Transfer Nodes (DTNs) and have over 400 TB of usable temporary storage. These servers are connected at 10 Gb/sec speed to WVU’s Science DMZ which is dedicated to transferring research data and is separated from other network traffic. This allows data to be transferred with low latency and high bandwidth to other locations.

DTNs are connected directly to the Spruce Knob HPC cluster which allows fast transfer of data to and from Spruce Knob. Data to Spruce Knob is transferred over FDR Infiniband at speeds up to 56 Gb/sec. In addition to HPC users, this space is for all researchers at WVU who need to temporarily store and transfer data to other locations at WVU or elsewhere throughout the world.

The preferred method for transferring data to and from the data transfer nodes is to use [Globus Online](#). Globus Online establishes a GridFTP service for transferring files which makes file transfer much faster as well as restartable if they fail. Data transfers throughput is improved when a user is transferring multiple files from a directory because the GridFTP service will send multiple files at the same time. In addition, users will receive notifications through email and the web interface of the status of the transfer. Globus Online provides users a very easy to use web interface for transferring files to other locations who have Globus Connect Servers or through Globus Connect Personal. Almost all major research institutions have access to Globus Online. In addition, users can install Globus Connect Personal on their personal computers for free. The application supports Windows, Linux, and Mac.

Please see the [Using Globus Online instructions](#) on how to use Globus Online with WVU’s Data Transfer Nodes.

Users may also use sftp to transfer files to and from the DTNs. To access the DTNs you need to use the hostname `data.hpc.wvu.edu` (i.e. `sftp username@data.hpc.wvu.edu`). However, `scp` and `rsync` are not permitted. **Note:** If you use sftp with the DTNs your directory structure will be different than you are using on Spruce Knob. Your landing directory upon login will be `/home/user_name`. Your scratch directory is located at `/scratch/user_name`.

**Note:** Data Transfer Nodes and Globus Online are only connected directly to Spruce Knob. If you need to transfer files to Mountaineer, you will need to use Alternative Transfer Methods and connect to `mountaineer.hpc.wvu.edu`.

## 2.7.2 Using Globus Online

**Review** <https://www.globus.org/researchers/getting-started> for a step by step guide on how to get a Globus Online Account and to start transferring files.

The following are the basic steps for getting started using Globus Online with WVU DTN Servers.

### Access Globus Online Web Portal

1. Go to <http://www.globus.org> with your web browser and select “Sign Up” if you do not already have access to Globus Online. If you already have access, select Log in in the upper right hand corner.
2. Search for your organization which will be “West Virginia University” and select “Continue”.
3. Select “West Virginia University” at the Identity Provider on the CiLogon Page and select “Log On”.
4. You will now be redirected to WVU’s Sign on Page. Here you will enter you WVU Logon information and select “LOGIN”.
5. You should now be successfully logged into Globus Online and ready to transfer file.

### Transfer Files with Globus Online

1. To transfer files to/from your local PC/workstation you need to install Globus Connect Personal. Please visit <https://www.globus.org/globus-connect-personal> and under “Downloads” select the version that matches your operating system. The next page will guide you through the process of installation. If you just need to transfer data between the WVU’s HPC center and another location that uses Globus Online you may skip this step.
2. Go to <https://www.globus.org/xfer/StartTransfer> to start the process of transferring files.
3. On the “Transfer Files” Page there will be a section for two endpoints. Each “Endpoint” can be be used to transfer files to and from the Endpoint to the other Endpoint. For WVU’s DTNs you will search for “wvu#hpcdtn”.
4. If you are using an endpoint that is not managed by WVU, you will be presented with the following request: “Please authenticate to access this endpoint”. Select “Continue” if you wish to continue.
5. A CiLogon page will be presented where you can select the appropriate Identity Provider for this endpoint. After you make your selection, please select “Logon On”.
6. You should now be presented with a login page from your Identity Provider.
7. On the WVU DTN Endpoint, your default file location will be `/gpfs`. You can transfer directly to/from your home directory, group directory, or scratch directory by selecting the desired path in the “Path” section.
8. By using selecting the file to transfer and use the arrows you should now be able to transfer files between end points. You should receive an email when your transfer completes or if there are errors. You can also monitor the transfer under the “Activity” section/tab.

Note: For those who prefer to use a command line interface (CLI) for data transfers, you may use Globus Online via the CLI.

## Globus Online Hints

1. Globus Online recently made an update that allows users to bookmark endpoints and specific directory locations. This makes it quicker and easier to transfer files after the first use. More information on bookmarks can be found at <https://www.globus.org/blog/greatly-improved-endpoint-search>.

## Using Globus Online with Pittsburgh Supercomputing Center (PSC)

WVU Researcher's have the option to purchase archival storage through PSC's [Data SuperCell](#). For more information on getting access to SuperCell please contact the Research Computing Help Desk at <https://helpdesk.hpc.wvu.edu>.

With the Data SuperCell, users can easily and quickly transfer files from WVU to PSC via Globus Online. Instructions on how to configure Globus Online to work with PSC's Data Supercell can be found [here](#).

## Globus Online Command Line Interface

For those who prefer to use a command line interface (CLI) for data transfers, you may use Globus Online via the CLI. Detailed instructions on how to utilize the CLI can be found at [<https://support.globus.org/entries/30058643-Using-the-Command-Line-Interface-CLI>- Globus Online CLI Instructions]. Below is an example of using Globus Online CLI for reference.

1. Ensure both end points you are using for the Globus Online transfer are activated and will not expire before the transfer completes. This can be done at [Globus Endpoints](#) and can also done from the command line via the following command.

```
:$> ssh globus_username@cli.globusonline.org endpoint-activate endpoint_name
:
```

2. You can use one of the following options with the transfer command to transfer files.

```
:Simple method: one file or recursive directory
:  transfer [OPTIONS] -- SOURCE-ENDPOINT/FILE DESTINATION-ENDPOINT/FILE
:  transfer [OPTIONS] -- SOURCE-ENDPOINT/DIRECTORY/ DESTINATION-ENDPOINT/DIRECTORY/ -r
:Advanced method: multiple input lines read from stdin
:  transfer [OPTIONS] < INPUT LINE(S)
:
```

3. Example Transfer:

- Create a file with a list of files to be transferred

```
:cat << EOF > /tmp/yourfilehere
:username#psc-cilogon/file.txt
:wvu#hpcdtn/gpfs/home/username/file.txt
:EOF
:
```

- Execute transfer command :

## 2.7.3 Alternative Transfer Methods

To transfer files to the Spruce Knob system and you prefer/can't use the Globus Online method described above, you may still use the Data Transfer nodes by using the **data.hpc.wvu.edu** hostname. **Note:** You can only use Globus

Online and SFTP with the Data Transfer Nodes. Other methods of transfer (ex. scp, and rsync) can be used for transfers against the login nodes but it is not recommended for large transfers.

## Using SCP

HPC clusters require authenticated connections that uses the encrypted protocol SSH, because of this regular ftp connections are blocked. SCP comes with all current Unix like operating systems (including Linux and Mac OS X) and is available from a terminal. To copy a single file using scp you can type

```
$> scp <filename> username@hostname:.
```

Where filename is the name of the file you want to be copied, and username is your username, hostname is the hostname of the cluster you are connecting to. You will be prompted for your username password, and then the transfer will begin after authentication. After the hostname address name you can specify where you want the file to be copied to and what the file will be named on the server. Using the scp command, a colon ':' must be specified after the target machines address, in the above example the period '.' tells scp to copy the file to the default directory (your home directory) and name the file the current filename. For instance, if the filename was 'python\_script.py', scp will copy the file to your home directory and name the file python\_script.py. If, for example, you wanted to copy the file to your SCRATCH directory (information about the SCRATCH directory can be found at the File System page) and name the file a different name you could use the command

```
$> scp <filename> username@hostname:$SCRATCH/new_filename
```

The above command will re-name the file to new\_filename and place it in your SCRATCH directory. If you instead want to copy over entire directories, this can be done with the -r option

```
$> scp -r <directory> username@hostname:.
```

The above command will copy recursively the specified directory from your local machine to your home directory on the cluster preserving filenames of the directory. A great option for copying over directories is to first tarball the directory into a single file. This can be done using the Unix tar command

```
$> tar cvzf archive.tar.gz <directory>
$> scp archive.tar.gz username@hostname:.
```

Then after connecting to the server through SSH, you can unarchive the tarball using

```
$> tar xvzf archive.tar.gz
```

The tar command compresses the directory (which will also speed up transfer time) into a single file. This is also a great way to combine multiple files on a local machine before transfer

```
$> tar cvzf archive.tar.gz <file1> <file2> ... <file100>
```

The archive.tar.gz is the name of the soon to be created tarball. You can name this file whatever you want, and file name extensions are not required, .tar.gz is recommended so you can quickly know that you are looking at a compressed tarball.

## Using WinSCP

For transferring files on a Windows computer, you will have to obtain a windows SCP client. We recommend [WinSCP](#), it's free and has a very easy to use graphical interface.

## FOR BASIC USERS

### 3.1 Terminal-based Text Editors

There are several terminal-based editors available on our clusters. We will focus our attention on three of them: nano, emacs, and vim. Your choice of an editor depends mostly on how much functionality do you want from your editor, how many fingers do you want to use for a given command and the learning curve to master it. For HPC users the editor is an important choice. Most of your time you are on the terminal executing commands or editing files, being those input files, submission scripts or the output of your calculations.

Let's review those three editors to give you the opportunity to have an informed choice.

#### 3.1.1 Nano

Nano is a small, free and friendly editor with commands that usually manage using the Control (CTRL) combined with some other key.

You can start editing a file using a command line like this:

```
nano myfile.f90
```

There are several commands available, the list below comes from the help text. When you see the symbol “^” it means to press the Control (CTRL) key, the symbol “M-” is called Meta, but in most keyboards is identified with the (Alt) key.

^G	(F1)	Display this help text
^X	(F2)	Close the current file buffer / Exit from nano
^O	(F3)	Write the current file to disk
^J	(F4)	Justify the current paragraph
.		
^R	(F5)	Insert another file into the current one
^W	(F6)	Search for a string or a regular expression
^Y	(F7)	Move to the previous screen
^V	(F8)	Move to the next screen
.		
^K	(F9)	Cut the current line and store it in the cutbuffer
^U	(F10)	Uncut from the cutbuffer into the current line
^C	(F11)	Display the position of the cursor
^T	(F12)	Invoke the spell checker, if available
.		
^_	(F13)	(M-G) Go to line and column number
^\	(F14)	(M-R) Replace a string or a regular expression
^^	(F15)	(M-A) Mark text at the cursor position
.	(F16)	(M-W) Repeat last search
.		

M-^	(M-6)	Copy the current line and store it in the cutbuffer
M-}		Indent the current line
M-{		Unindent the current line
.		
^F		Move forward one character
^B		Move back one character
^Space		Move forward one word
M-Space		Move back one word
^P		Move to the previous line
^N		Move to the next line
.		
^A		Move to the beginning of the current line
^E		Move to the end of the current line
M-(	(M-9)	Move to the beginning of the current paragraph
M-)	(M-0)	Move to the end of the current paragraph
M-\	(M- )	Move to the first line of the file
M-/	(M-?)	Move to the last line of the file
M-]		Move to the matching bracket
M--	(M-\_)	Scroll up one line without scrolling the cursor
M++	(M-=)	Scroll down one line without scrolling the cursor
M-<	(M-,)	Switch to the previous file buffer
M->	(M-.)	Switch to the next file buffer
M-V		Insert the next keystroke verbatim
^I		Insert a tab at the cursor position
^M		Insert a newline at the cursor position
^D		Delete the character under the cursor
^H		Delete the character to the left of the cursor
M-T		Cut from the cursor position to the end of the file
M-J		Justify the entire file
M-D		Count the number of words, lines, and characters
^L		Refresh (redraw) the current screen
M-X		Help mode enable/disable
M-C		Constant cursor position display enable/disable
M-O		Use of one more line for editing enable/disable
M-S		Smooth scrolling enable/disable
M-P		Whitespace display enable/disable
M-Y		Color syntax highlighting enable/disable
M-H		Smart home key enable/disable
M-I		Auto indent enable/disable
M-K		Cut to end enable/disable
M-L		Long line wrapping enable/disable
M-Q		Conversion of typed tabs to spaces enable/disable
M-B		Backup files enable/disable
M-F		Multiple file buffers enable/disable
M-M		Mouse support enable/disable
M-N		No conversion from DOS/Mac format enable/disable
M-Z		Suspension enable/disable

The most basic usage is to edit a file, and exit from the editor with CTRL-X. Nano ask you if you want to save the file, you answer “Y” and offers you a name. Simply press ENTER and your file is saved.

### 3.1.2 Emacs

Emacs is an extensible, customizable, open-source text editor. Together with Vi/Vim is one the most widely used editors in Linux environments. There are a big number of commands, customizations and extra modules that can be integrated with Emacs. We will just go briefly covering the basics.

The number of commands for Emacs is large, here the basic list of commands for editing, moving and searching text.

=== Entering Emacs ===

`emacs <filename>`

=== Leaving Emacs ===

suspend Emacs (or iconify it under X) C-z exit Emacs permanently C-x C-c

=== Files ===

read a file into Emacs C-x C-f save a file back to disk C-x C-s save all files C-x s insert contents of another file into this buffer C-x i replace this file with the file you really want C-x C-v write buffer to a specified file C-x C-w toggle read-only status of buffer C-x C-q

=== Incremental Search ===

search forward C-s search backward C-r regular expression search C-M-s reverse regular expression search C-M-r select previous search string M-p select next later search string M-n exit incremental search RET undo effect of last character DEL abort current search C-g Use C-s or C-r again to repeat the search in either direction. If Emacs is still searching, C-g cancels only the part not matched.

=== Motion ===

entity to move over backward forward character C-b C-f word M-b M-f line C-p C-n go to line beginning (or end) C-a C-e sentence M-a M-e paragraph M-{ M-} page C-x [ C-x ] sexp C-M-b C-M-f function C-M-a C-M-e go to buffer beginning (or end) M-< M-> scroll to next screen C-v scroll to previous screen M-v scroll left C-x < scroll right C-x > scroll current line to center, top, bottom C-l goto line M-g g goto char M-g c back to indentation M-m

=== Killing and Deleting ===

entity to kill backward forward character (delete, not kill) DEL C-d word M-DEL M-d line (to end of) M-0 C-k C-k sentence C-x DEL M-k sexp M- C-M-k C-M-k kill region C-w copy region to kill ring M-w kill through next occurrence of char M-z char yank back last thing killed C-y replace last yank with previous kill M-y

=== Marking ===

set mark here C-@ or C-SPC exchange point and mark C-x C-x set mark arg words away M-@ mark paragraph M-h mark page C-x C-p mark sexp C-M-@ mark function C-M-h mark entire buffer C-x h

=== Query Replace ===

interactively replace a text string M-% using regular expressions M-x query-replace-regexp Valid responses in query-replace mode are

replace this one, go on to next SPC or y replace this one, don't move , skip to next without replacing DEL or n replace all remaining matches ! back up to the previous match ^ exit query-replace RET enter recursive edit (C-M-c to exit) C-r

=== Formatting ===

uppercase word M-u lowercase word M-l capitalize word M-c uppercase region C-x C-u lowercase region  
C-x C-l

### 3.1.3 Vi/Vim

The third editor widely supported on Linux systems is “vi”. Over the years since its creation, vi became the *de-facto* standard Unix editor. The Single UNIX Specification specifies vi, so every conforming system must have it.

vi is a modal editor: it operates in either insert mode (where typed text becomes part of the document) or normal mode (where keystrokes are interpreted as commands that control the edit session). For example, typing i while in normal mode switches the editor to insert mode, but typing i again at this point places an “i” character in the document. From insert mode, pressing ESC switches the editor back to normal mode.

Vim is an improved version of the original vi, it offers

Here is a summary of the main commands used on vi. On Spruce when using “vi” you are actually using “vim”.

#### To Start vi

To use vi on a file, type in vi filename. If the file named filename exists, then the first page (or screen) of the file will be displayed; if the file does not exist, then an empty file and screen are created into which you may enter text:

```
vi filename    edit filename starting at line 1
vi -r filename    recover filename that was being edited when the system crashed
```

#### To Exit vi

Usually, the new or modified file is saved when you leave vi. However, it is also possible to quit vi without saving the file. Note: The cursor moves to bottom of the screen whenever a colon (:) is typed. This type of command is completed by hitting the <Return> (or <Enter>) key:

```
:x<Return>    quit vi, writing out modified file to file named in original invocation
:wq<Return>    quit vi, writing out modified file to file named in original invocation
:q<Return>    quit (or exit) vi
:q!<Return>   quit vi even though latest changes have not been saved for this vi call
```

#### Moving the Cursor

Unlike many of the PC and MacIntosh editors, the mouse does not move the cursor within the vi editor screen (or window). You must use the the key commands listed below. On some UNIX platforms, the arrow keys may be used as well; however, since vi was designed with the Qwerty keyboard (containing no arrow keys) in mind, the arrow keys sometimes produce strange effects in vi and should be avoided. If you go back and forth between a PC environment and a UNIX environment, you may find that this dissimilarity in methods for cursor movement is the most frustrating difference between the two. In the table below, the symbol ^ before a letter means that the <Ctrl> key should be held down while the letter key is pressed:

```
j or <Return> [or down-arrow]    move cursor down one line
k [or up-arrow]                  move cursor up one line
h or <Backspace> [or left-arrow]  move cursor left one character
```

<code>l</code> or <code>&lt;Space&gt;</code> [or right-arrow]	move cursor right one character
<code>0</code> (zero)	move cursor to start of current line (the one with the cursor)
<code>\$</code>	move cursor to end of current line
<code>w</code>	move cursor to beginning of next word
<code>b</code>	move cursor back to beginning of preceding word
<code>:0&lt;Return&gt;</code> or <code>1G</code>	move cursor to first line in file
<code>:n&lt;Return&gt;</code> or <code>nG</code>	move cursor to line <code>n</code>
<code>:\$&lt;Return&gt;</code> or <code>G</code>	move cursor to last line in file

## Screen Manipulation

The following commands allow the vi editor screen (or window) to move up or down several lines and to be refreshed.

- ^f** move forward one screen
- ^b** move backward one screen
- ^d** move down (forward) one half screen
- ^u** move up (back) one half screen
- ^l** redraws the screen
- ^r** redraws the screen, removing deleted lines

## Adding, Changing, and Deleting Text

This command acts like a toggle, undoing and redoing your most recent action. You cannot go back more than one step.

- u** UNDO WHATEVER YOU JUST DID; a simple toggle

## Inserting or Adding Text

The following commands allow you to insert and add text. Each of these commands puts the vi editor into insert mode; thus, the `<Esc>` key must be pressed to terminate the entry of text and to put the vi editor back into command mode.

- i** insert text before cursor, until `<Esc>` hit
- I** insert text at beginning of current line, until `<Esc>` hit
- a** append text after cursor, until `<Esc>` hit
- A** append text to end of current line, until `<Esc>` hit
- o** open and put text in a new line below current line, until `<Esc>` hit
- O** open and put text in a new line above current line, until `<Esc>` hit

## Changing Text

The following commands allow you to modify text.

- r** replace single character under cursor (no `<Esc>` needed)
- R** replace characters, starting with current cursor position, until `<Esc>` hit
- cw** change the current word with new text, starting with the character under cursor, until `<Esc>` hit
- cNw** change `N` words beginning with character under cursor, until `<Esc>` hit; e.g., `c5w` changes 5 words

**C** change (replace) the characters in the current line, until <Esc> hit

**cc** change (replace) the entire current line, stopping when <Esc> is hit

**Ncc or cNc** change (replace) the next N lines, starting with the current line, stopping when <Esc> is hit

## Deleting Text

The following commands allow you to delete text.

**x** delete single character under cursor

**Nx** delete N characters, starting with character under cursor

**dw** delete the single word beginning with character under cursor

**dNw** delete N words beginning with character under cursor; e.g., d5w deletes 5 words

**D** delete the remainder of the line, starting with current cursor position

**dd** delete entire current line

**Ndd** delete N lines, beginning with the current line; e.g., 5dd deletes 5 lines

**dNd** same as Ndd

## Cutting and Pasting Text

The following commands allow you to copy and paste text.

**yy** copy (yank, cut) the current line into the buffer

**Nyy** copy (yank, cut) the next N lines, including the current line, into the buffer

**yNy** same as Nyy

**p** put (paste) the line(s) in the buffer into the text after the current line

## Searching Text

A common occurrence in text editing is to replace one word or phrase by another. To locate instances of particular sets of characters (or strings), use the following commands.

**/string** search forward for occurrence of string in text

**?string** search backward for occurrence of string in text

**n** move to next occurrence of search string

**N** move to next occurrence of search string in opposite direction

## Determining Line Numbers

Being able to determine the line number of the current line or the total number of lines in the file being edited is sometimes useful.

**:. =** returns line number of current line at bottom of screen

**: =** returns the total number of lines at bottom of screen

**^g** provides the current line number, along with the total number of lines, in the file at the bottom of the screen

## Saving and Reading Files

These commands permit you to input and output files other than the named file with which you are currently working.

```
:r filename<Return> read file named filename and insert after current line (the line with cursor)
:w<Return> write current contents to file named in original vi call
:w newfile<Return> write current contents to a new file named newfile
:12,35w smallfile<Return> write the contents of the lines numbered 12 through 35 to a new file named
    smallfile
:w! prevfile<Return> write current contents over a pre-existing file named prevfile
```

## 3.2 Terminal-based Text Editors

There are several terminal-based editors available on our clusters. We will focus our attention on three of them: nano, emacs, and vim. Your choice of an editor depends mostly on how much functionality do you want from your editor, how many fingers do you want to use for a given command and the learning curve to master it. For HPC users the editor is an important choice. Most of your time you are on the terminal executing commands or editing files, being those input files, submission scripts or the output of your calculations.

Let's review those three editors to give you the opportunity to have an informed choice.

### 3.2.1 Nano

Nano is a small, free and friendly editor with commands that usually manage using the Control (CTRL) combined with some other key.

You can start editing a file using a command line like this

```
“ nano myfile.f90“
```

There are several commands available, the list below comes from the help text. When you see the symbol “^” it means to press the Control (CTRL) key, the symbol “M-” is called Meta, but in most keyboards is identified with the (Alt) key.

<b>^G</b>	(F1)	Display this help text
<b>^X</b>	(F2)	Close the current file buffer / Exit from nano
<b>^O</b>	(F3)	Write the current file to disk
<b>^J</b>	(F4)	Justify the current paragraph
<b>^R</b>	(F5)	Insert another file into the current one
<b>^W</b>	(F6)	Search for a string or a regular expression
<b>^Y</b>	(F7)	Move to the previous screen
<b>^V</b>	(F8)	Move to the next screen
<b>^K</b>	(F9)	Cut the current line and store it in the cutbuffer
<b>^U</b>	(F10)	Uncut from the cutbuffer into the current line
<b>^C</b>	(F11)	Display the position of the cursor
<b>^T</b>	(F12)	Invoke the spell checker, if available
<b>^_</b>	(F13) (M-G)	Go to line and column number
<b>^\</b>	(F14) (M-R)	Replace a string or a regular expression
<b>^^</b>	(F15) (M-A)	Mark text at the cursor position
	(F16) (M-W)	Repeat last search

M-^	(M-6)	Copy the current line and store it in the cutbuffer
M-}		Indent the current line
M-{		Unindent the current line
^F		Move forward one character
^B		Move back one character
^Space		Move forward one word
M-Space		Move back one word
^P		Move to the previous line
^N		Move to the next line
^A		Move to the beginning of the current line
^E		Move to the end of the current line
M-(	(M-9)	Move to the beginning of the current paragraph
M-)	(M-0)	Move to the end of the current paragraph
M-\	(M- )	Move to the first line of the file
M-/	(M-?)	Move to the last line of the file
M-]		Move to the matching bracket
M--	(M-_)	Scroll up one line without scrolling the cursor
M-+	(M-=)	Scroll down one line without scrolling the cursor
M-<	(M-,)	Switch to the previous file buffer
M->	(M-.)	Switch to the next file buffer
M-V		Insert the next keystroke verbatim
^I		Insert a tab at the cursor position
^M		Insert a newline at the cursor position
^D		Delete the character under the cursor
^H		Delete the character to the left of the cursor
M-T		Cut from the cursor position to the end of the file
M-J		Justify /_staticthe entire file
M-D		Count the number of words, lines, and characters
^L		Refresh (redraw) the current screen
M-X		Help mode enable/disable
M-C		Constant cursor position display enable/disable
M-O		Use of one more line for editing enable/disable
M-S		Smooth scrolling enable/disable
M-P		Whitespace display enable/disable
M-Y		Color syntax highlighting enable/disable
M-H		Smart home key enable/disable
M-I		Auto indent enable/disable
M-K		Cut to end enable/disable
M-L		Long line wrapping enable/disable
M-Q		Conversion of typed tabs to spaces enable/disable
M-B		Backup files enable/disable
M-F		Multiple file buffers enable/disable
M-M		Mouse support enable/disable
M-N		No conversion from DOS/Mac format enable/disable
M-Z		Suspension enable/disable

The most basic usage is to edit a file, and exit from the editor with CTRL-X. Nano ask you if you want to save the file, you answer “Y” and offers you a name. Simply press ENTER and your file is saved.

### 3.2.2 Emacs

Emacs is an extensible, customizable, open-source text editor. Together with Vi/Vim is one the most widely used editors in Linux environments. There are a big number of commands, customizations and extra modules that can be integrated with Emacs. We will just go briefly covering the basics.

The number of commands for Emacs is large, here the basic list of commands for editing, moving and searching text.

#### Entering Emacs

:: emacs

#### Leaving Emacs

suspend Emacs (or iconify it under X) C-z

exit Emacs permanently C-x C-c

#### Files

read a file into Emacs C-x C-f

save a file back to disk C-x C-s

save all files C-x s

insert contents of another file into this buffer C-x i

replace this file with the file you really want C-x C-v

write buffer to a specified file C-x C-w

toggle read-only status of buffer C-x C-q

#### Incremental Search

search forward C-s

search backward C-r

regular expression search C-M-s

reverse regular expression search C-M-r

select previous search string M-p

select next later search string M-n

exit incremental search RET

undo effect of last character DEL

abort current search C-g

Use C-s or C-r again to repeat the search in either direction. If

Emacs is still searching, C-g cancels only the part not matched.

#### Motion

entity to move over backward forward

character C-b C-f

word M-b M-f

line C-p C-n

go to line beginning (or end) C-a C-e  
sentence M-a M-e  
paragraph M-{ M-}  
page C-x [ C-x ]  
sexp C-M-b C-M-f  
function C-M-a C-M-e  
go to buffer beginning (or end) M-< M->  
scroll to next screen C-v  
scroll to previous screen M-v  
scroll left C-x <  
scroll right C-x >  
scroll current line to center, top, bottom C-l  
goto line M-g g  
goto char M-g c  
back to indentation M-m

## **Killing and Deleting**

entity to kill backward forward  
character (delete, not kill) DEL C-d  
word M-DEL M-d  
line (to end of) M-0 C-k C-k  
sentence C-x DEL M-k  
sexp M-- C-M-k C-M-k  
kill region C-w  
copy region to kill ring M-w  
kill through next occurrence of char M-z char  
yank back last thing killed C-y  
replace last yank with previous kill M-y

## **Marking**

set mark here C-@ or C-SPC  
exchange point and mark C-x C-x  
set mark arg words away M-@  
mark paragraph M-h  
mark page C-x C-p  
mark sexp C-M-@  
mark function C-M-h  
mark entire buffer C-x h

## **Query Replace**

interactively replace a text string M-%  
using regular expressions M-x query-replace-regexp  
Valid responses in query-replace mode are

```

replace this one, go on to next SPC or y
replace this one, don't move ,
skip to next without replacing DEL or n
replace all remaining matches !
back up to the previous match ^
exit query-replace RET
enter recursive edit (C-M-c to exit) C-r

```

## Formatting

```

indent current line (mode-dependent) TAB
indent region (mode-dependent) C-M-\
indent sexp (mode-dependent) C-M-q
indent region rigidly arg columns C-x TAB
indent for comment M-;
insert newline after point C-o
move rest of line vertically down C-M-o
delete blank lines around point C-x C-o
join line with previous (with arg, next) M-^
delete all white space around point M-\
put exactly one space at point M-SPC
fill paragraph M-q
set fill column to arg C-x f
set prefix each line starts with C-x .
set face M-o

```

## Case Change

```

uppercase word M-u
lowercase word M-l
capitalize word M-c
uppercase region C-x C-u
lowercase region C-x C-l

```

### 3.2.3 Vi/Vim

The third editor widely supported on Linux systems is “vi”. Over the years since its creation, vi became the *\*de-facto\** standard Unix editor. The Single UNIX Specification specifies vi, so every conforming system must have it.

vi is a modal editor: it operates in either insert mode (where typed text becomes part of the document) or normal mode (where keystrokes are interpreted as commands that control the edit session). For example, typing i while in normal mode switches the editor to insert mode, but typing i again at this point places an “i” character in the document. From insert mode, pressing ESC switches the editor back to normal mode.

Vim is an improved version of the original vi, it offers

Here is a summary of the main commands used on vi. On Spruce when using “vi” you are actually using “vim”.

## To Start vi

To use vi on a file, type in `vi filename`. If the file named `filename` exists, then the first page (or screen) of the file will be displayed; if the file does not exist, then an empty file and screen are created into which you may enter text.

```
vi filename      edit filename starting at line 1
vi -r filename  recover filename that was being edited when the system crashed
```

## To Exit vi

Usually, the new or modified file is saved when you leave vi. However, it is also possible to quit vi without saving the file. Note: The cursor moves to bottom of the screen whenever a colon (:) is typed. This type of command is completed by hitting the (or ) key.

```
:x<Return>  quit vi, writing out modified file to file named in original invocation
:wq<Return>  quit vi, writing out modified file to file named in original invocation
:q<Return>  quit (or exit) vi
:q!<Return> quit vi even though latest changes have not been saved for this vi call
```

## Moving the Cursor

Unlike many of the PC and MacIntosh editors, the mouse does not move the cursor within the vi editor screen (or window). You must use the the key commands listed below. On some UNIX platforms, the arrow keys may be used as well; however, since vi was designed with the Qwerty keyboard (containing no arrow keys) in mind, the arrow keys sometimes produce strange effects in vi and should be avoided. If you go back and forth between a PC environment and a UNIX environment, you may find that this dissimilarity in methods for cursor movement is the most frustrating difference between the two. In the table below, the symbol ^ before a letter means that the key should be held down while the letter key is pressed.

j or <Return> [or down-arrow]	move cursor down one line
k [or up-arrow]	move cursor up one line
h or <Backspace> [or left-arrow]	move cursor left one character
l or <Space> [or right-arrow]	move cursor right one character
0 (zero)	move cursor to start of current line (the one with the cursor)
\$	move cursor to end of current line
w	move cursor to beginning of next word
b	move cursor back to beginning of preceding word
:0<Return> or lG	move cursor to first line in file
:n<Return> or nG	move cursor to line n
:\$<Return> or G	move cursor to last line in file

## Screen Manipulation

The following commands allow the vi editor screen (or window) to move up or down several lines and to be refreshed.

```
^f move forward one screen
^b move backward one screen
^d move down (forward) one half screen
^u move up (back) one half screen
^l redraws the screen
```

`^r` redraws the screen, removing deleted lines

## Adding, Changing, and Deleting Text

This command acts like a toggle, undoing and redoing your most recent action. You cannot go back more than one step.

“ `u` UNDO WHATEVER YOU JUST DID; a simple toggle“

## Inserting or Adding Text

The following commands allow you to insert and add text. Each of these commands puts the vi editor into insert mode; thus, the key must be pressed to terminate the entry of text and to put the vi editor back into command mode.

```
i  insert text before cursor, until <Esc> hit
I  insert text at beginning of current line, until <Esc> hit
a  append text after cursor, until <Esc> hit
A  append text to end of current line, until <Esc> hit
o  open and put text in a new line below current line, until <Esc> hit
O  open and put text in a new line above current line, until <Esc> hit
```

## Changing Text

The following commands allow you to modify text.

```
r  replace single character under cursor (no <Esc> needed)
R  replace characters, starting with current cursor position, until <Esc> hit
cw change the current word with new text, starting with the character under cursor, until <Esc> hit
cNw  change N words beginning with character under cursor, until <Esc> hit; e.g., c5w changes 5 words
C  change (replace) the characters in the current line, until <Esc> hit
cc change (replace) the entire current line, stopping when <Esc> is hit
Ncc or cNc change (replace) the next N lines, starting with the current line, stopping when <Esc> is hit
```

## Deleting Text

The following commands allow you to delete text.

```
x  delete single character under cursor
Nx delete N characters, starting with character under cursor
dw delete the single word beginning with character under cursor
dNw  delete N words beginning with character under cursor; e.g., d5w deletes 5 words
D  delete the remainder of the line, starting with current cursor position
dd delete entire current line
Ndd  delete N lines, beginning with the current line; e.g., 5dd deletes 5 lines
dNd  same as Ndd
```

## Cutting and Pasting Text

The following commands allow you to copy and paste text.

```
yy  copy (yank, cut) the current line into the buffer
```

Nyy      copy (yank, cut) the next N lines, including the current line, into the buffer  
yNy      same as Nyy

p          put (paste) the line(s) in the buffer into the text after the current line

## Searching Text

A common occurrence in text editing is to replace one word or phrase by another. To locate instances of particular sets of characters (or strings), use the following commands.

/string      search forward for occurrence of string in text  
?string      search backward for occurrence of string in text  
n      move to next occurrence of search string  
N      move to next occurrence of search string in opposite direction

## Determining Line Numbers

Being able to determine the line number of the current line or the total number of lines in the file being edited is sometimes useful.

:=      returns line number of current line at bottom of screen  
:=      returns the total number of lines at bottom of screen

^g provides the current line number, along with the total number of lines, in the file at t

## Saving and Reading Files

These commands permit you to input and output files other than the named file with which you are currently working.

:r filename“      read file named filename and insert after current line (the line with cursor)“  
:w“      write current contents to file named in original vi call“  
:w newfile“      write current contents to a new file named newfile“  
:12,35w smallfile“      write the contents of the lines numbered 12 through 35 to a new file named smallfile“  
:w! prevfile“      write current contents over a pre-existing file named prevfile“

## 3.3 Globus Online

### 3.3.1 Overview

For a quick start guide please visit: [Globus: How to Get Started](#).

If you need further assistance beyond this documentation, please contact [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu).

### 3.3.2 Transfer Data

Use Globus Online web browser to transfer data files between your PC/workstation and the WVU HPC systems. There are two dedicated servers, data transfer nodes (DTNs), that are connected to WVU's Science DMZ (REX) that allow data to be transferred with low latency and high bandwidth across WVU campus as well as to other locations around the globe. This space is available for all researchers at WVU who need to temporarily store and transfer data.

#### Logging in and transferring files

Visit the URL [Globus Online](#) to login.

Select West Virginia University from the organizational list and login using your WVU Login username and password.

#### Transferring data to your local workstations/PC

To learn how to transfer data to your local workstation, you will need to install Globus Connect Personal.

### 3.3.3 Share Data

Use Globus Online to share your data files with researchers located at other institutions around the world without needing administrative assistance.

**Note** If you are not using an endpoint that starts with `wvu\#`, before you can start sharing data using Globus, you must contact Research Computing and request that a shared endpoint be created for you.

### 3.3.4 Archive Data

Globus Online provides an easy mechanism for researchers to archive their data sets for free to their MIX Google Drive account via a [Google Drive Connector](#). All WVU faculty and students have unlimited storage in Google Drive through their MIX account. Staff can request a MIX account by contacting [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu). Google Drive gives researchers a safe environment to archive their data sets, which replicates between multiple data centers to prevent data loss. Note: You can also use the Google Drive web interface as well as the [Google Drive Sync Client](#) to transfer files to your Google Drive MIX account; however, the sync client and web interface is best used for small files (Example .docx, .pdf, etc.). Globus Google Drive Connector is optimized for transferring a large number of files as well as very large files, which cannot be done, via the Google Drive Web Interface on Sync Client. You will see the best performance with Google Drive Connector with transferring several large files at once. If you have many small files, it might be best to zip/tar these files first before transferring to Google Drive.

**Google Drive is not approved for use of sensitive or protected data sets (i.e. HIPPA, FERPA, ITAR, subject to Export Control laws, etc.). If you need assistance archiving these types of data sets, please contact [helpdesk@hpc.wvu.edu](mailto:helpdesk@hpc.wvu.edu).**

To archive data to a Google Drive you will need to follow the instructions in the Globus Online Google Drive Connector Instructions, which will guide you on how to make a Shared Endpoint that you can attach to your MIX Google Drive Account to transfer data to/from.

#### Globus Online Google Drive Connector Instructions

- **Note:** In step one, when searching all endpoints you will need to search for 'wvu#gdrive'.

To transfer files to your MIX Google Drive Account, review the "Transfer Data" Section above. You will want to select the name of the Shared Endpoint you just created in step 3 as one of the two endpoints. The other endpoint could be a WVU endpoint, such as `wvu#hpcdtn` or a personal endpoint you created that connects to your workstation/PC.

### 3.3.5 Publish Data

Use Globus Online to publish your datasets, possibly as a requirement from a granting agency. Published datasets are organized by communities and their member collections and are searchable by other Globus users.

**Note** If you are not using an endpoint that starts with `wvu\#`, before you can start sharing data using Globus, you must contact Research Computing and request that a shared endpoint be created for you.

For more information on how to publish your data sets using Globus Online, visit [Globus, Data Publication User Guide](#).

## 3.4 Samples of Job Submission scripts

Below are bash scripts that can be modified and submitted to the `qsub` command for job submission. For details about the different parts of the scripts please visit the [Running Jobs](#) page. These scripts can be copied and pasted in the terminal using any number of text editors (i.e. `vi`, `emacs`, etc...)

### 3.4.1 Script for running a non-array batch queue

The below script has PBS directives to set-up commonly used variables such as job name, resources needed, e-mail address upon job completion and abnormal termination and specify a queue to run on

```
#!/bin/sh

#This is an example script for executing generic jobs with
# the use of the command 'qsub <name of this script>'

#These commands set up the Grid Environment for your job. Words surrounding by a bracket ('<', '>') s
#Any of the PBS directives can be commented out by placing another pound sign in front
#example
##PBS -N name
#The above line will be skipped by qsub because of the two consecutive # signs

# Specify job name
#PBS -N <name>

# Specify the resources need for the job
# Walltime is specified as hh:mm:ss (hours:minutes:seconds)
#PBS -l nodes=<number_of_nodes>:ppn=<number_of_processors_per_node>,walltime=<time_needed_by_job>

# Specify when Moab should send e-mails 'ae' below user will
# receive e-mail for any errors with the job and/or upon completion
# If you don't want e-mails just comment out these next two PBS lines
#PBS -m ae

# Specify the e-mail address to receive above mentioned e-mails
#PBS -M <email_address>

# Specify the queue to execute task in. Current options can be found by excuting the command qstat -
#PBS -q <queue_name>

# Enter your command below with arguments just as if you where going to execute on the command line
```

---

```
# It is generally good practice to issue a 'cd' command into the directory that contains the files
# you want to use or use full path names
```

### 3.4.2 Script for running an array batch queue

Script is the same as above, but adds PBS -t to execute array request job submissions.

```
#!/bin/sh
```

```
#This is an example script for executing genetic jobs with
# the use of the command 'qsub <name of this script>'
```

```
#These commands set up the Grid Environment for your job. Words surrounding by a bracket ('<', '>') should be
#Any of the PBS directives can be commented out by placing another pound sign in front
#example
##PBS -N name
#The above line will be skipped by qsub because of the two consecutive # signs
```

```
# Specify job name, use ${PBS_ARRAYID} to ensure names and output/error files have different names
#PBS -N <name_${PBS_ARRAYID}>
```

```
# Specify the range for the PBS_ARRAYID environment variable
# <num_range> can be a continuous range like 1-200 or 5-20
# or <num_range> can be a comma separated list of numbers like 5,15,20,55
# You can also specify the maximum number of jobs queued at one time with the percent sign
# so a <num_range> specified as 5-45%8 would launch forty jobs with a range from 5-45, but only queue
# all jobs are completed.
# Further, you can mix and match continuous range and list like 1-10,15,25-40%10
#PBS -t <num_range>
```

```
# Specify the resources need for the job
# Walltime is specified as hh:mm:ss (hours:minutes:seconds)
#PBS -l nodes=<number_of_nodes>:ppn=<number_of_processors_per_node>,walltime=<time_needed_by_job>
```

```
# Specify when Moab should send e-mails 'ae' below user will
# receive e-mail for any errors with the job and/or upon completion
# If you don't want e-mails just comment out these next two PBS lines
#PBS -m ae
```

```
# Specify the e-mail address to receive above mentioned e-mails
#PBS -M <email_address>
```

```
# Specify the queue to execute task in. Current options can be found by executing the command qstat -o
#PBS -q <queue_name>
```

```
# Enter your command below with arguments just as if you were going to execute on the command line
# It is generally good practice to issue a 'cd' command into the directory that contains the files
# you want to use or use full path names
# Any parameter or filename that needs to use the current job number of the array number range use $
```

## 3.5 Environment Modules

### 3.5.1 What are Modulefiles

Modulefiles are files written in the Tool Command Language (Tcl) and are used by the module command to implement different environments for particular applications. Whenever a user on a Unix/Linux based system runs applications, compiles code, etc. what the user can successfully do is determined by the current shell environment. The most common application of this concept is the Unix/Linux PATH shell environment. When a user types a command, that command is either referenced by a full path name: e.g. /usr/bin/some\_dir/another\_dir/command\_utility or the path needs to be specified in the user's PATH shell environment. Another example is when a particular user compiles application code, often several libraries need to be accessible and their are Unix shell environment variables that direct the compiler where to look (e.g. LD\_LIBRARY\_PATH). On a moderately sized or large cluster this becomes somewhat complicated to keep track of all the libraries and commands available on the system. An example would be compile-time libraries: often on a HPC system there are several versions of the same library to fulfill all user's needs. If all libraries were available by default to all users there is a good chance that application code would access the incorrect versions and cause errors. Modulefiles can be loaded and unloaded to modify certain shell environment variables to make applications available to the user and not interfere with other applications.

On RC HPC managed systems we use modulefiles to control shell environment for any libraries, compilers, and software that are installed locally (not globally located by default). In addition, modulefiles contain useful information such as version numbers, URLs for webpages and manuals, and MAN page information. Further, modulefiles are a great way to see what software, libraries and compilers are available on our systems.

### 3.5.2 Listing available modulefiles

To list the currently available modulefiles on the system use the module command with the available subcommand:

```
$> module available
```

```
----- /usr/share/Modules/software -----
chemistry/autodock_vina  genomics/clump  genomics/muscle  genomics/tabix
chemistry/gamess        genomics/cufflinks  genomics/phase  genomics/tablet
chemistry/gaussian/g03  genomics/distruct  genomics/phrap  genomics/tophat2
chemistry/gromacs        genomics/eigensoft  genomics/picard-tools  genomics/trf
data/cdf/3.5.0.2         genomics/emboss    genomics/plink  genomics/trinity
data/hdf5/1.8.12         genomics/fastq36   genomics/qiime  genomics/vcftools
genomics/abyss           genomics/fastqc    genomics/repeatexplorer  gnu/parallel
genomics/allpaths        genomics/fastx_toolkit  genomics/rsem  mae/elk/2.3.16
genomics/beagle          genomics/gatk       genomics/samtools  statistics/matlab
genomics/bedtools        genomics/hmmer      genomics/shapeit
genomics/blast           genomics/igv        genomics/soapdenovo
genomics/bowtie2         genomics/lastz      genomics/structure

----- /usr/share/Modules/development -----
compilers/gcc/4.8.2      libraries/DFS/myhadoop  libraries/hdf5/1.8.12  mpi/mpich2/1.2.1
compilers/gcc/4.9.0      libraries/bupc/2.2      libraries/mkl/4.1.1.036  mpi/mvapich2/1.9
compilers/intel/14.0     libraries/cdf/3.5.0.2  mpi/intel/4.1.1.036     mpi/openmpi/1.6.5
```

The output of the available subcommand informs the full path where the modulefiles are located (e.g. /usr/share/Modules/software) as well as a list of modulefiles in that particular location (e.g. gnu/parallel). Importantly, all modulefiles are sectioned by categories. For instance, all compiler modulefiles start with 'compilers/' (i.e. compilers/gcc/4.8.2). The module available command can be given words for matching, and will return modulefiles that start with the given word. For instance, if you want to list all MPI modulefiles:

```
$>module available mpi
```

```
----- /usr/share/Modules/development -----  
mpi/intel/4.1.1.036 mpi/mpich2/1.2.1      mpi/mvapich2/1.9      mpi/openmpi/1.6.5
```

Further, you can list all gcc compilers:

```
$>module available compilers/gcc
```

```
----- /usr/share/Modules/development
compilers/gcc/4.8.2 compilers/gcc/4.9.0
```

### 3.5.3 Showing what a modulefile does

Viewing the contents of a modulefile can be done using the module command with the show subcommand:

```
$> module show compilers/intel/14.0
```

```
/usr/share/Modules/development/compilers/intel/14.0:
```

```
module-whatis      Name: Intel Compiler
module-whatis      Version: 14.0
module-whatis      Category: compiler, runtime support
module-whatis      Description: Intel Compiler Family (C/C++/Fortran for x86_64)
module-whatis      URL: http://software.intel.com/en-us/articles/intel-compilers/
setenv             INTEL_LICENSE_FILE 28519@srih0001.hpc.wvu.edu
prepend-path       PATH /shared/software/intel/bin
prepend-path       MANPATH /shared/software/intel/man
prepend-path       LD_LIBRARY_PATH /shared/software/intel/lib/intel64
```

the modulefile starts with the location of the modulefile (/usr/share/Modules/development/compilers/intel/14.0). The next few lines module-whatis gives information about version numbers, categories for tools, URLs for more information. If you only want to see these first few lines you can use the `whatis` subcommand:

```
$> module whatis compilers/intel/14.0
```

```
compilers/intel/14.0 : Name: Intel Compiler
compilers/intel/14.0 : Version: 14.0
compilers/intel/14.0 : Category: compiler, runtime support
compilers/intel/14.0 : Description: Intel Compiler Family (C/C++/Fortran for x86_64)
compilers/intel/14.0 : URL: http://software.intel.com/en-us/articles/intel-compilers/
```

Returning back to the actual modulefile, after the `whatis` lines you have specific `Tcl` commands that modify the environment. In this example we have two types of commands: 1) `setenv` which creates a shell environment variable (`INTEL_LICENSE_FILE` in this case). 2) `prepend-path` statement which modify a current shell environment variable. In this case the first `prepend-path` modifies the `PATH` environment variable by adding `/shared/software/intel/bin` to make that directory available to the user. More information about `Tcl` commands found in modulefiles can be found in the modulefile manpage (`man modulefile`).

### 3.5.4 Loading and Unloading modulefiles

Loading and unloading modulefiles can be done using the module command the subcommands load and unload. In this example, the Intel C compiler is named icc:

```
$> icc
-bash: icc: command not found

$> module load compilers/intel
$> icc
icc: command line error: no files specified; for help type "icc -help"

$> module unload compilers/intel
$> icc
-bash: icc: command not found
```

As shown in the above command, initially the `icc` commands could not be found. After loading the module, `icc` could be found (although I gave it no input so it gave me an error), and as expected after unloading the module `icc` could not be found anymore. For more information about module subcommands see the module manpage (`man module`)

### 3.5.5 Using modulefiles through qsub

Modulefiles can be used through the scheduler just as on the command line. In your batch shell script (see [Running Jobs](#) for details) you can place the module load/unload or any other module subcommand directly before you executed commands.

## 3.6 Managing Scratch Contents

Scratch is designed to be a high-performance, low-latency, parallel file system and it is uniquely built for HPC systems. That means that data is allocated in parallel on several virtual disks intended to be read and write in parallel from several computers. In order for the scratch system to perform its best the files should be balanced across all disks and frequently used files should also being balanced.

In the page we will offer some tricks that will help you regain control of your scratch space in preparation to transferring your files to other locations.

### 3.6.1 Knowing my current usage

First we should know what we have in terms of used space and number of files

```
$ /usr/lpp/mmfs/bin/mmlsquota --block-size M gpfs01:scratch
      Block Limits
Filesystem Fileset  type      MB      quota      limit  in_doubt  grace |      File Limits
gpfs01     scratch  USR      1943448  62914560  68157440      235    none |      files  quot
```

You can also get this information in GigaBytes

```
$ /usr/lpp/mmfs/bin/mmlsquota --block-size G gpfs01:scratch
      Block Limits
Filesystem Fileset  type      GB      quota      limit  in_doubt  grace |      File Limits
gpfs01     scratch  USR        1898    61440    66560         1    none |      files  quot
```

On this case I am using almos 1900 GB of data in half million files. I would like to reduce as much as possible before trying to move my data out of Scratch. We will focus on command line tricks that will help you search for Big files, search for small and numerous files. The idea is to attack first the biggest contributors to my usage. This examples will be as generic as possible. At the end of the day its up to you to decide which data is not longer needed and can be safely deleted.

Consider delete a irreversible procedure, there is a way to recover files that have been deleted very recently but do not count on it. Being sure that you delete what you actually want to delete. The commands below are powerful and with that power comes a danger too.

### 3.6.2 Searching for empty files

An empty file is still a file. Even if apparently not using space its metadata still exists and any transfer of that file is also a file operation. This is something that in most cases is harmless. Be careful, in some cases empty files are used for some codes to indicate run conditions. Their sole existence carries a meaning.

On Spruce every user has an environmental variable pointing to their personal Scratch folder. You can see that variable with:

```
$ echo $SCRATCH
/scratch/<USERNAME>
```

On this examples we will use this variable to allow you to copy and paste this commands in total generality

```
find $SCRATCH -size 0
```

I got thousands of files. Some of them I do not want to remove, but there are quite a number of files like this:

```
./OrbitalGAF/58d36a1374d8b558e47f9623/58d36a1374d8b558e47f9623.e1165669
./OrbitalGAF/58d46c6d74d8b558e47f9cf7/58d46c6d74d8b558e47f9cf7.o1172814
./OrbitalGAF/58d46c6d74d8b558e47f9cf7/58d46c6d74d8b558e47f9cf7.e1172814
./OrbitalGAF/58d36a1374d8b558e47f9629/58d36a1374d8b558e47f9629.o1165671
./OrbitalGAF/58d36a1374d8b558e47f9629/58d36a1374d8b558e47f9629.e1165671
./OrbitalGAF/58d46c6d74d8b558e47f9cc7/58d46c6d74d8b558e47f9cc7.o1172802
./OrbitalGAF/58d46c6d74d8b558e47f9cc7/58d46c6d74d8b558e47f9cc7.e1172802
./OrbitalGAF/58d46c6d74d8b558e47f9cca/58d46c6d74d8b558e47f9cca.o1172803
./OrbitalGAF/58d46c6d74d8b558e47f9cca/58d46c6d74d8b558e47f9cca.e1172803
./OrbitalGAF/58d46c6d74d8b558e47f9cd3/58d46c6d74d8b558e47f9cd3.o1172806
./OrbitalGAF/58d46c6d74d8b558e47f9cd3/58d46c6d74d8b558e47f9cd3.e1172806
./OrbitalGAF/58d46c6d74d8b558e47f9cd6/58d46c6d74d8b558e47f9cd6.o1172807
./OrbitalGAF/58d46c6d74d8b558e47f9cd6/58d46c6d74d8b558e47f9cd6.e1172807
./OrbitalGAF/58d46c6d74d8b558e47f9cd9/58d46c6d74d8b558e47f9cd9.o1172808
./OrbitalGAF/58d46c6d74d8b558e47f9cd9/58d46c6d74d8b558e47f9cd9.e1172808
./OrbitalGAF/58d46c6d74d8b558e47f9cf4/58d46c6d74d8b558e47f9cf4.o1172813
./OrbitalGAF/58d46c6d74d8b558e47f9cf4/58d46c6d74d8b558e47f9cf4.e1172813
./OrbitalGAF/58d36a1374d8b558e47f963e/58d36a1374d8b558e47f963e.o1165678
./OrbitalGAF/58d36a1374d8b558e47f963e/58d36a1374d8b558e47f963e.e1165678
./OrbitalGAF/58d46c6d74d8b558e47f9cb5/58d46c6d74d8b558e47f9cb5.o1172796
./OrbitalGAF/58d46c6d74d8b558e47f9cb5/58d46c6d74d8b558e47f9cb5.e1172796
./OrbitalGAF/58d46c6d74d8b558e47f9cbe/58d46c6d74d8b558e47f9cbe.o1172799
./OrbitalGAF/58d46c6d74d8b558e47f9cbe/58d46c6d74d8b558e47f9cbe.e1172799
./OrbitalGAF/58d46c6d74d8b558e47f9cc1/58d46c6d74d8b558e47f9cc1.o1172800
./OrbitalGAF/58d46c6d74d8b558e47f9cc1/58d46c6d74d8b558e47f9cc1.e1172800
./OrbitalGAF/58d46c6d74d8b558e47f9cc4/58d46c6d74d8b558e47f9cc4.o1172801
./OrbitalGAF/58d46c6d74d8b558e47f9cc4/58d46c6d74d8b558e47f9cc4.e1172801
./OrbitalGAF/58d36a1374d8b558e47f9653/58d36a1374d8b558e47f9653.o1165683
```

All those are empty files created by Torque/Moab from simulations that I have carried out in the past. Those files in the format:

```
<JOB_NAME>.o<JOB_ID_NUMBER>
<JOB_NAME>.e<JOB_ID_NUMBER>
```

Those files contain the standard Output (o) and Standard Error (e) from the jobs that run on Spruce. Many of those files are empty because on my executions I usually send the output of the command to some other file and because

the codes that I use do not write anything on the standard error. Deleting those empty files will not help me with my storage usage by it will reduce the number of files that I will have to move later on.

I can target those files with a more specific command:

```
find $SCRATCH -size 0 -regextype posix-egrep -regex ".*\.[o,e][0-9]{5,7}"
```

The command above search for all empty files on Scratch that contains. On my account I found thousands of cases that I can safely delete. In most cases those files are not important to you to keep. They are empty and not used at all other than telling you the JOB\_ID that you probably do not need for old jobs. If you feel comfortable deleting those files you can execute:

```
find $SCRATCH -size 0 -regextype posix-egrep -regex ".*\.[o,e][0-9]{5,7}" -exec rm {} \;
```

On my case it help me delete 16113 files

### 3.6.3 Searching for Big Files

Some problems and codes produce big files. In some cases those files are not needed to extract the actual answers for which you run those calculations and could be deleted safely. The first step is knowing where they are. This command search for files bigger than 2GB

```
find $SCRATCH -size +2G
```

You can increase or decrease the value if you are getting too many or very few. Once you identify the biggest files you can use the their names to target those files for deletion. Imagine that the files called “WAVECAR” can be deleted. You can use this command”

```
find $SCRATCH -size +2G -name "WAVECAR" -exec rm {} \;
```

## 3.7 XWindow

### 3.7.1 Introduction to X

To view a graphical user interface (GUI) from one of HPC systems you will need to have a X Windows System (often shorten to just ‘X’) installed on your PC. UNIX based operating systems (Linux and Mac OS X) come with an X Window terminal called X11. For Windows based machines, you will need to install one.

Once you have a functioning X Server running on your PC, you will need to tunnel your graphics program from the HPC system to your PC.

**Note:** You may execute lite (i.e. not resource intensive) GUI programs on the login nodes of the HPC systems. However, these should be programs cannot be resource intensive. If you need to run programs such as MATLAB and you plan on doing computation through the MATLAB GUI, you will need to submit your job to the scheduler.

### 3.7.2 Launching X (GUI Programs)

#### Linux/OS X Instructions

With Linux or OS X you can simply run the command below from your terminal window to enable X11 forward through SSH.

```
$> ssh -XC username@hostname
```

To verify your X setup, you can run the command “xclock” from the terminal. If you have successfully tunneled your X traffic, you should see a small clock show up on your screen which you may now close. If you are not seeing a clock, please open a HelpDesk Ticket for further assistance.

## Windows Instructions

Windows does not have a built in X11 Server so one will need to be installed. Below are instructions for **Xming** which is compatible with Putty but you may also want to look into **MobaXterm**.

1. Download Xming from here <https://sourceforge.net/projects/xming/files/Xming/6.9.0.31/Xming-6-9-0-31-setup.exe/download>.
2. Install and follow the on-screen instructions. If you do not already have Putty installed you will want to select “Full Installation” when you get to the “Select Components” screen.
3. At the end of the installation you can keep “Launch Xming” selected or launch Xming from your start menu.
4. When Xming is running, you will have a icon in your Windows systray that looks like an “X”.
5. Follow the Putty Instructions to setup connectivity but before you click “Open” be sure to set “Enable X11 forwarding” under the Category Option section. This will be under Connection, SSH, and X11. Example:

6. You should now be connected to an HPC system with X Forward enabled.

7. To verify your X setup, you can run the command “xclock” from the terminal. If you have successfully tunneled your X traffic, you should see a small clock show up on your screen which you may now close. If you are not seeing a clock, please open a HelpDesk Ticket for further assistance.

### 3.7.3 Running X (GUI Programs) on Computing Nodes

GUI intensive programs must be ran on a compute node. To accomplish this, one will need to follow the applicable above steps to first establish a X session to an HPC system. Once this has been accomplished you will need to run the following command which will launch an interactive job and give you terminal access on a compute node. Note: The following command is just an example and you will still need to set the appropriate pbs flags that meets the task’s needs.

```
$> qsub -q standby -X -I
```

## FOR ADVANCED USERS

### 4.1 Conda and BioConda

### 4.2 Singularity Containers

Containers are a software technology that allows us to keep control of the environment where a given code runs. Consider for example that you want to run a code in such a way the same code runs on several machines or clusters ensuring that the same libraries are loaded and the same general environment is present. Different clusters could come installed with different compilers, different Linux distributions and different libraries in general. Containers can be used to package entire scientific workflows, software and libraries, and even data and move them to several compute infrastructures with complete reproducibility.

Containers are similar to Virtual Machines, however, the differences are enough to consider them different technologies and those differences are very important for HPC. Virtual Machines takes up a lot of system resources. Each Virtual Machine (VM) runs not just a full copy of an operating system, but a virtual copy of all the hardware that the operating system needs to run. This quickly adds up to a lot of precious RAM and CPU cycles, valuable resources for HPC.

In contrast, all that a container requires is enough of an operating system, supporting programs and libraries, and system resources to run a specific program. From the user perspective, a container is in most cases a single file that contains the file system, ie a rather complete Unix filesystem tree with all libraries, executables, and data that are needed for a given workflow or scientific computation.

There are several container solutions, one prominent example is Docker, however, the main issue with containers is security, despite the name, containers do not actually contain the powers of the user who executes code on them. That is why you do not see Docker installed on an HPC cluster. Using dockers requires superuser access something that on shared resources like an HPC cluster is not widely offered.

Singularity offers an alternative solution to Docker, users can run the prepared images that we are offering on Spruce or bring their own.

For more information about Singularity and complete documentation see: <https://singularity.lbl.gov/quickstart>

#### 4.2.1 How to use a singularity Image

There are basically two scenarios, interactive execution and job submission.

##### Interactive Job

If you are using Visit or RStudio, programs that uses the X11 forwarding, ensure to connect first to the cluster with X11 forwarding, before asking for an interactive job. In order to connect into Spruce with X11 forwarding use:

```
ssh -X <username>@spruce.hpc.wvu.edu
```

Once you have login into the cluster, create an interactive job with the following command line, in this case we are using standby as queue but any other queue is valid.

```
qsub -X -I -q standby
```

Once you get inside a compute node, load the module:

```
module load singularity/2.5.1
```

After loading the module the command singularity is available for usage, and you can get a shell inside the image with:

```
singularity shell /shared/software/containers/<Image Name>
```

## Job Submission

In this case you do not need to export X11, just login into Spruce

```
ssh <username>@spruce.hpc.wvu.edu
```

Once you have login into the cluster, create a submission script (“runjob.pbs” for this example), in this case we are using standby as queue but any other queue is valid.

```
#!/bin/sh
```

```
#PBS -N JOB
```

```
#PBS -l nodes=1:ppn=1
```

```
#PBS -l walltime=04:00:00
```

```
#PBS -m ae
```

```
#PBS -q standby
```

```
module load singularity/2.5.1
```

```
singularity exec /shared/software/containers/<Image Name> <command_or_script_to_run>
```

Submit your job with

```
qsub runjob.pbs
```

## 4.2.2 Central Installed Singularity Images

Currently, we are offering the following Images on Spruce, these images were created to bind the shared folders that we currently offer on Spruce (/users, /gpfs, /group and /scratch). The recipes allows verifying how each of those images were created and give you a template for creating your own. Notice that in order to create a Singularity image you need root access, so you need to install Singularity on your own computer to create the image there and transfer the created image file back to Spruce.

### Keras 2.4 + TensorFlow 1.5 with GPU support

Keras is a high-level neural networks API, written in Python and capable of running on top of TensorFlow, CNTK, or Theano. It was developed with a focus on enabling fast experimentation. Being able to go from idea to result with the least possible delay is key to doing good research.

**Webpage:** <https://keras.io>

**Image Name:** Keras-2.1.4\_TensorFlow-1.5.0.simg

**Recipe:**

```
Bootstrap: docker
From: gw000/keras-full

%environment
SHELL=/bin/bash
export SHELL
VARIABLE=HELLO-CUDA-EXAMPLE
export VARIABLE

%labels
AUTHOR gufranco@mail.wvu.edu

%post
. /environment
echo 'SHELL=/bin/bash' >> /environment
chmod +x /environment
mkdir -p /users
mkdir -p /group
mkdir -p /gpfs
mkdir -p /data
mkdir -p /scratch
touch /usr/bin/nvidia-smi

%files
hello.cu          # copied to root of container
hello
Keras-2.1.4_TensorFlow-1.5.0.bst
```

### RStudio Desktop 1.1 with R 3.4.3

RStudio is an integrated development environment (IDE) for R. It includes a console, syntax-highlighting editor that supports direct code execution, as well as tools for plotting, history, debugging and workspace management.

## Stacks 2.1

Stacks is a software pipeline for building loci from short-read sequences, such as those generated on the Illumina platform. Stacks was developed to work with restriction enzyme-based data, such as RAD-seq, for the purpose of building genetic maps and conducting population genomics and phylogeography.

## TensorFlow Official version with GPU support

TensorFlow™ is an open source software library for high-performance numerical computation. Originally developed by researchers and engineers from the Google Brain team within Google's AI organization, it comes with strong support for machine learning and deep learning and the flexible numerical computation core is used across many other scientific domains.

The image included, comes from the official dockers repository running on Python 3 and supporting GPUs

**Webpage:** <https://www.tensorflow.org>

**Image Name:** TensorFlow\_gpu\_py3.simg

## Visit 2.13.2

VisIt is an Open Source, interactive, scalable, visualization, animation and analysis tool. From Unix, Windows or Mac workstations, users can interactively visualize and analyze data ranging in scale from small (<101 core) desktop-sized projects to large (>105 core) leadership-class computing facility simulation campaigns. Users can quickly generate visualizations, animate them through time, manipulate them with a

variety of operators and mathematical expressions, and save the resulting images and animations for presentations. VisIt contains a rich set of visualization features to enable users to view a wide variety of data including scalar and vector fields defined on two- and three-dimensional (2D and 3D) structured, adaptive and unstructured meshes. Owing to its customizable plugin design, VisIt is capable of visualizing data from over 120 different scientific data formats.

## 4.3 Singularity Containers

## 4.4 Installing Packages in User Locations

### 4.4.1 Overview: GNU Build System

To install packages on GNU/Linux systems, packages that are programmed in C/C++ or other compiled languages need to be compiled and installed. A large majority of these packages will use the GNU Build system, which can be broken into three distinct stages: 1) Configuring the package, 2) Building the package and 3) installing the package. These three stages are controlled by two programs: ‘configure’ and ‘make’. ‘make’ is a Linux utility that is pre-installed on all Linux systems. While ‘configure’ will be come with the package as it provides package specific information to the ‘make’ utility. Installing these packages can be done in three steps, but user specific options will need to be given to make sure the package is installed correctly. This page will provide instructions on how to build these packages without superuser privileges.

#### Setting up the Directory Structure

Before you can start the build/install process, you need to set up the directory structure. There are many different ideologies and principles on how to do this. Here, I will show only the strategy we use on the Research Computing clusters to install and manage software. Throughout this page, I’m going to use the package name ‘example\_pkg-1.4.7.tar.gz’ to demonstrate the commands. This package naming style is very common, and will most likely be the naming convention you encounter.

The directory structure we use, is to have a parent directory for the package name, and then three subsequent directories named ‘build’, ‘source’, and ‘install’. This directory topology allows us to distinguish the source and build trees from each other (more on what this means below), and keep versions in the install directory. That way, if you upgrade or change versions of software, all versions of the same software package can be located in the same parent directory. In our example, this directory structure can be made using:

```
mkdir example_pkg
cd example_pkg
mkdir build source install
```

You then move the tarball into the source directory, and extract the files:

```
mv example_pkg-1.4.7.tar.gz example_pkg/source
cd example_pkg/source
tar xzvf example_pkg-1.4.7.tar.gz
```

This should create the directory `example_pkg-1.4.7`, and this extracted directory is called the ‘source tree’ since it contains only source files and nothing compiled or built.

## The Configure Stage

Once the directory structure is set up, we now have to configure the build tree, to compile and install the software package. This is done by running the ‘configure’ script. There are two general steps of configure. First, you need to load the appropriate dependency environments. Second, you need to tell configure where you want to install the software.

On most systems, you will not have to load dependency environments, however, on you do on Research Computing clusters; and this will be the norm for almost all High Performance Computing clusters. Loading dependency environments are done through module files. The dependencies for each particular package will be different, but they should be listed within the installation manual either on the package website or within the `readme/install` file. The `readme/install` file is almost always within the top directory of the extracted package directory as `README` and/or `INSTALL`. For example, it might be `example_pkg-1.4.7/README` in our example.

With the correct module files loaded, you now can run the configure script. You will want to provide the ‘`--prefix`’ option to tell configure where to install the software. You will additionally, want to run the configure script from the build directory that we set up earlier. This is good practice, and allows easy cleaning (what is referred to as `VPATH` building).

```
cd example_pkg/build
mkdir 1.4.7
cd 1.4.7
../../source/example_pkg-1.4.7/configure --prefix=/users/username/example_pkg/install/1.4.7
```

This command will tell configure to install the binaries, libraries, documentation, etc.. in `/users/username/example_pkg/install/1.4.7` directory. The configure process will output a large amount of package information to the screen. And if the correct dependencies are loaded and the package is well built, this process should complete without error. If not, it’s almost certainly because of a missing dependency. If you do not understand the error (most will be missing package ‘`XXYY`’), and you need help to resolve it, please use our helpdesk ticket system to request help.

## The Make/Build Stage

If the configure step finishes without error. The Make/Build step can be completed with the single command from within the build directory (directory you ran configure in):

```
make
```

## The Install Stage

If the configure step finishes without error, it is almost certain that the make step will finish (unless the package maintainers incorrectly built the configure script). Therefore, the install step can be completed with the single command.

Again from within the build directory:

```
make install
```

This command will put all the binaries, libraries, documentation wherever you specified using the `--prefix` option.

## 4.4.2 Additional Documentation

- [GNU Autoconf Manual](#)
- [GNU Automake Manual](#)
- [GNU Make Manual](#)

## 4.5 Miniconda

Sometimes you want complete control on your Python installation rather than rely on the packages and versions provided for you by the central installed python installation. This page will guide you in the process of installing miniconda on your home account. We describe here how to download, install and update a miniconda installation that will give you complete control on the packages that you have and the pace on which those packages will be updated.

### 4.5.1 Downloading Miniconda

Miniconda can be downloaded from:

```
wget https://repo.continuum.io/miniconda/Miniconda3-latest-Linux-x86_64.sh
sh Miniconda3-latest-Linux-x86_64.sh
```

### 4.5.2 No installing anything

Just load the module:

```
module purge
module load genomics/qiime
```

This module will load python 2.7.3 and qiime on top of that

### 4.5.3 Installing QIIME on a virtual environment on top of python 2.7.13

Use this:

```
module purge
module load compilers/python/2.7.13

virtualenv veqiime
cd veqiime
source ./bin/activate
pip install numpy
pip install qiime (this step takes around a minute)
```

After installation all that you have to do is:

```
module load compilers/python/2.7.13
cd veqiime
source ./bin/activate
```

and qiime is ready for use.

## 4.5.4 Installing QIIME on top of python 2.7.13 (No virtual env)

Execute:

```
module purge module load compilers/python/2.7.13

pip install qiime --user
```

In this case qiime will be installed locally on your home directory at:

```
~/.local/lib/python2.7/site-packages
```

All that you have to do is:

```
module load compilers/python/2.7.13
```

And qiime is ready for use.

## 4.5.5 Installing with Miniconda

First install miniconda following the instructions:

```
wget https://repo.continuum.io/miniconda/Miniconda3-latest-Linux-x86_64.sh
sh Miniconda3-latest-Linux-x86_64.sh
source ~/.bashrc

conda install numpy

conda create -n qiime1 python=2.7 qiime matplotlib=1.4.3 mock nose -c bioconda
```

Finally follow the instructions at the end of the installation

To activate this environment, use:

```
> source activate qiime1
```

To deactivate this environment, use:

```
> source deactivate qiime1
```

## 4.6 Using MPI on RC HPC Clusters

Many parallel programs take advantage of Message Passing Interface (MPI) to communicate across compute nodes and efficiently scale up computational analysis. While we can't give instructions on how to run every program using MPI, all the programs using MPI need to be told which hosts and cpus to run. Generally, most programs use the mpirun executable that comes pre-packaged with MPI libraries to accomplish this task. The general syntax for running parallel programs with mpirun is:

```
mpirun -np <processor number> -machinefile <procs file> command [..args]
```

With `-np` option specifying the number of processors the job requires, and the `-machinefile` option with a file that contains the host address and number of CPUs to use on each host. On a distributed computing cluster with a scheduler in place (both RC clusters), the number of processors will be the same number of processors requested with the `qsub` command. Further, it is almost impossible to know which hosts your job will run on, since that is determined by a number of factors with the current state of the system. Therefore Moab/Torque provides a machinefile for each job that is executed through the scheduler, and its location is stored in the `$PBS_NODEFILE` variable. Therefore, on our clusters, the general syntax of running a program parallel with MPI is:

```
module load <mpi/modulefile>
```

```
mpirun -np <processor number> -machinefile $PBS_NODEFILE command [..args]
```

with being the appropriate module file for the MPI package the program was compiled with. Of course, you should consult the programs documentation for details, as some programs come with their own `mpirun` substitute and/or work better with certain MPI libraries than others. Also, each MPI libraries have differences with their `mpirun` commands, and therefore you should take a look at the MPI's own documentation (links below).

## 4.6.1 MPI Standards

Message Passing Interface standards are available free for download at [www.mpi-forum.org](http://www.mpi-forum.org).

## 4.6.2 Useful Books

Parallel Programming with MPI. Peter Pecheco. ISBN-13:978-1558603394

Parallel Programming in C with MPI and OpenMP. Michael Quinn. ISBN-13:978-0072822564

MPI: The Complete Reference. Snir et al. ISBN-13:978-0262692168

## 4.6.3 Libraries

Current information about location and version of library can be found in their respective modulefiles.

Library	Documentation

OpenMPI	<a href="http://www.open-mpi.org/doc/">http://www.open-mpi.org/doc/</a>

## 4.7 Executing HADOOP jobs

### 4.7.1 What is Hadoop

Hadoop is an open-source software package that utilizes large scale data processing by using the Hadoop Distributed File System (HDFS) to provide fast bandwidth of large data across clusters. Using the Hadoop interface, it is possible to split large data across both nodes and processors to increase data processing time. Hadoop's advantage is processing large data files (gigabytes to terabyte range), in a non-POSIX compliant filesystem to increase throughput performance. Hadoop is currently installed on the Spruce Knob cluster.

## 4.7.2 Using Hadoop on the cluster

Running Hadoop jobs are very similar to running other jobs on the cluster. You will run all of your commands within a PBS job script. However, before you run Hadoop commands, you need to start the Hadoop datanode. To do this, you need to load a few module files and run a few start-up scripts. In addition a specific PBS directive (PBS -W) needs to be specified so Hadoop runs properly:

```
#PBS -W x=nmatchpolicy:exactnode

module load compilers/java/jre1.8.0
module load libraries/DFS/myhadoop

source $MH_HOME/etc/spruce_default.conf
myhadoop-configure.sh

start-all.sh
```

Below these lines, you can place your intended hadoop commands. At the end of your script, you need to stop the hadoop datanode:

```
stop-all.sh

myhadoop-cleanup.sh
```

Both of these commands will end the Hadoop backend. Hadoop commands after the cleanup scripts will result in errors. Here is an example Hadoop script that will run on 3 nodes with 1 processor a node. The example is a word-count program that is distributed with Hadoop that counts the presence of all words in small sample of Shakespeare playwrights taken from Project Gutenberg.

```
#!/bin/bash

#PBS -q standby
#PBS -N hadoop_job
#PBS -l nodes=3:ppn=1
#PBS -o hadoop_run.out
#PBS -e hadoop_run.err
#PBS -W x=nmatchpolicy:exactnode
#PBS -V

module load compilers/java/jre1.8.0
module load libraries/DFS/myhadoop

# Configure myHadoop environment
source $MH_HOME/etc/spruce_default.conf
myhadoop-configure.sh

# Start Hadoop Cluster
start-all.sh

#### Run your jobs here
echo "Run some test Hadoop jobs"
hadoop dfs -mkdir Data
hadoop dfs -copyFromLocal $HADOOP_HOME/data/gutenberg Data
hadoop dfs -ls Data/gutenberg
hadoop jar /shared/software/myhadoop/hadoop-1.2.1/hadoop-examples-1.2.1.jar wordcount Data/gutenberg
hadoop dfs -ls Outputs
echo
```

```
#### Stop the Hadoop cluster
stop-all.sh

#### Cleanup myHadoop configurations
myhadoop-cleanup.sh

exit 0
```

### 4.7.3 R Interface with Hadoop - Rhipe

Running large datasets within R is difficult since R loads all data into memory. However, using Hadoop with R can overcome that limitation. To use the R package Rhipe, after setting up the hadoop datanode, you can load the two modules for the dynamically shared R binary and the Rhipe R package:

```
module load compilers/R/3.1.0
module load libraries/R/Rhipe
```

Note: Rhipe must be loaded after the R module - otherwise you will get a pre-requisite error.

### 4.7.4 Further Information

#### Useful Webpages

- [Apache Hadoop](#)
- [Myhadoop Sourceforge](#)
- [Rhipe](#)

#### Useful Books

Hadoop: The Definitive Guide. Tom White. ISBN: 978-1-4493-1152-0

Parallel R. Q.E. McCallum and S. Watson. ISBN: 978-1-4493-0992-3

## 4.8 Python Modules

Python modules are installed using the DistUtils tools. This can either be done through the packaged setup.py script within the package distribution tarball:

```
python setup.py install
```

Or without downloading the package, you can use the installer tools pip:

```
pip install <package_name>
```

Or easy\_install:

```
easy_install <package_name>
```

The above commands will install the module in the system-wide site package directory usually located at /usr/local/lib/pythonX.Y/site-packages. However, on the any machine where you do not have superuser privileges, including the Research Computing clusters, this will throw a permission error. Therefore, you need to modify the commands instructing python to use an user scheme installation.

### 4.8.1 Python User Flag

An easy way to install Python modules locally (within your user directory) is by using the User flag with the DistUtils installation methods:

```
python setup.py install --user
```

```
pip install --user <package_name>
```

The User Flag directs python to install the package in a user site package directory usually located at `/lib/pythonX.Y/site-packages`, with usually being a hidden directory in the user's home directory. This is generally the preferred method of locally installing modules as this user site package is by default in the python library path: meaning modules installed this way can be used as if they were installed system-wide.

### 4.8.2 Python Home/Prefix Flag

Another way to install Python modules locally is by using the Home flag or the Prefix flag with the DistUtils installation:

```
$> python setup.py install --home=<dir>
```

Or

```
python setup.py install --prefix=<dir>
```

Using pip:

```
pip install --target <dir> <package_name>
```

Using easy\_install:

```
easy_install --install-dir=<dir> <package_name>
```

With

representing the directory location you want the package installed into. These flags essentially do the same thing by directing Python to install the module in the specified directory. These directories will not be searched by default with Python. Therefore, in order to use these modules in your Python scripts you will have to modify the PYTHONPATH environment variable to include the specified directory. Or alternatively, modify `sys.path` from within your python script (for this method, consult [python documentation](#)).

```
export PYTHONPATH=<dir>
```

### 4.8.3 Virtual Environments

The problem with Python User, Home and Prefix flags are that they will all be searched secondary to the system-wide site package. This is a problem if you are trying to install locally a different version of a module already installed system-wide. A way to get around this is by using Python Virtual Environments.

#### Installing R Packages in default Directories

The two usual ways to install R packages from CRAN is either executing

```
install.packages('<Package Name>')
```

from the R prompt. Or using the command

```
R CMD INSTALL <package>
```

from the command line. The second command only works if you have already downloaded a copy of the package from CRAN or an external site. The first will automatically download the package from CRAN. R will automatically detect that you do not have permissions to write in the system-wide R library folder and will prompt if you would like to install in a local directory from within your home directory. This folder will also be checked automatically when you run R for packages, allowing you to use anything you install in this way.

## Installing R Packages in non-default directories

### 4.8.4 Using `install.packages()`

To use `install.packages` from the R prompt, before you start R you need to modify the `R_LIBS` environment variable

```
export R_LIBS=<dir>
```

Then inside the R prompt you execute `install.packages()` as normal (see above).

### 4.8.5 Using R CMD INSTALL

For 'R CMD INSTALL' command, you can specify the path with the `l` flag (lowercase 'L')

```
R CMD INSTALL -l <dir> <package_name>
```

### 4.8.6 Using Installed Packages from non-default directories

To use locally installed packages, before you execute R you just need to modify the `R_LIBS` environment variable to tell R where to search for local packages.

```
export R_LIBS=<dir>
```

## 4.9 Python and scientific libraries

**Module:** languages/python/2.7.13

**Module:** languages/python/3.6.0

**Path** /shared/software/languages/python/2.7.13

**Path** /shared/software/languages/python/3.6.0

**Date** January 24, 2017

Python currently has two active versions, there are some important differences that prevent python code from running with python 3. That means that some packages are currently no python 3 ready and some of them will never be. Python 2 will stop being supported on 2020, so until that happens python 2 and 3 will coexist and that is the reason why we keep both on our cluster.

### 4.9.1 Packages included

```
* Python-2.7.13
* Python-3.6.0
```

## 4.9.2 Libraries included

We provide a comprehensive collection of scientific libraries for python:

### Python 2.7 and 3.6

```
:: coverage (4.3.4) cycler (0.10.0) Cython (0.25.2) dask (0.13.0) decorator (4.0.11) future (0.16.0) h5py (2.6.0)
   ipython (5.1.0) ipython-genutils (0.1.0) matplotlib (2.0.0) mpmath (0.19) networkx (1.11) nose (1.3.7)
   numpy (1.12.0) olefile (0.44) pandas (0.19.2) pexpect (4.2.1) performance (0.5.1) pickleshare (0.7.4) Pil-
   low (4.0.0) pip (9.0.1) prompt-toolkit (1.0.9) ptyprocess (0.5.1) Pygments (2.2.0) pymongo (3.4.0) pypars-
   ing (2.1.10) python-dateutil (2.6.0) pytz (2016.10) scikit-image (0.12.3) scikit-learn (0.18.1) scipy (0.18.1) sim-
   plegeneric (0.8.1) six (1.10.0) sympy (1.0) toolz (0.8.2) traitlets (4.3.1) virtualenv (15.1.0) wcwidth (0.1.7)
```

### Python 2.7 only

```
:: appdirs (1.4.0) backports.shutil-get-terminal-size (1.0.0) enum34 (1.1.6) functools32 (3.2.3.post2) packaging (16.8)
   pathlib2 (2.2.1) scandir (1.4) setuptools (34.0.2) subprocess32 (3.2.7) wheel (0.29.0)
```

### Python 3.6 only

```
:: CacheControl (0.11.7) lockfile (0.12.2) natsort (5.0.1) requests (2.13.0) scikit-bio (0.5.1) setuptools (28.8.0)
```

## 4.9.3 Notes from building

Python 2 and 3 were compiled with ‘sqlite’ support and python 3 with ‘lzma’. SQLite is used by IPython to record history of commands and LZMA is a newer compression algorithm that Python 3 is linked to.

Both versions were compiled with GCC 6.3.0 with Link-time optimization (LTO) and Profile-guided optimization (PGO) to maximize performance in production runs.

Compilation proceeded with (similar for 6.3.0):

```
../configure --prefix=/shared/software/languages/python/2.7.13
make profile-opt
make install
```

The Makefile was modified to remove the command option `-fuse-linker-plugin`

```

## 4.10 Python Virtual Environments

Python virtual environments are used to build completely isolated python workflows. Primarily they are used to solve the need for multiple versions within python modules. Often, you might have the need to use pkgA which needs pkgC version 1.24, but you also need pkgB which needs pkgC version 2.1. If you use setuptools to install the packages (i.e. pip or easy\_install), you will create a dependency issue since both versions of pkgC will be installed to the same location.

To resolve this, you can create python virtual environments that all isolation of package dependencies, so you can successfully have different versions of packages installed and tied to separate python interpreters. Setting up python virtual environments is easy, and using them is no different than using python it's self.

### 4.10.1 Using Virtual Environments with python2

First, load which version of python2 you would like to use as your base python interpreter. For instance, if you want python 2.7.10, then load the 2.7.10 python modulefile. If you want to use the default system python (v. 2.6), then you do not need to load a python modulefile. However, you do need to load the virtualenv modulefile.

```
module load compilers/python/2.7.10 compilers/python/virtualenv
```

Then create a virtualenv directory with the 'virtualenv' command.

```
virtualenv workflow1
```

You should now have a directory called 'workflow1'. You can use whatever name you want for the virtualenv, so long as you remember what directory corresponds with what environment. You now need to simply activate the virtualenv.

```
source workflow1/bin/activate
```

Your command prompt will now be pre-empted by (workflow1) to remind you that you have an activate virtualenv. You can now proceed to use python, pip, and easy\_install just as you would regularly.

### 4.10.2 Using Virtual Environments with python3

First, load the python3 modulefile. The python3 modulefile comes with it's own virtual environment utility, so you do not need to load the virtualenv modulefile.

```
module load compilers/python/3.5.1
```

Then create a virtualenv directry with the 'pyvenv' command.

```
pyvenv workflow1
```

You should now have a directory called ‘workflow1’. You can use whatever name you want for the virtualenv, so long as you remember what directory corresponds with what environment. You now need to simply activate the virtualenv.

```
source workflow1/bin/activate
```

Your command prompt will now be pre-empted by (workflow1) to remind you that you have an activate virtualenv. You can now proceed to use python, pip, and easy\_install just as you would regularly.

### 4.10.3 Activating virtual environments using the C shell

If you are using the shells csh or tcsh, you will not be able to source the ‘activate’ file. Instead, you need to source the activate.csh file.

```
source workflow1/bin/activate.csh
```

### 4.10.4 Using site-wide system packages

The centrally installed python interpreters (python loaded with modelefiles), usually have some common scientific packages installed with them by default. For instance, python 2.7.10 already has Numpy 1.9.2 and Matplotlib 1.4.2 installed. To have your virtualenv keep using these packages so you do not need to install them in your virtualenv, using the `--system-site-packages` option.

```
virtualenv --system-site-packages
```

Or

```
pyvenv --systems-site-packages
```

## FOR DEVELOPERS

### 5.1 Programming Languages

#### 5.1.1 Python

#### 5.1.2 R Language

#### 5.1.3 C and C++

#### 5.1.4 Fortran

### 5.2 Parallel Programming

### 5.3 GCC: The GNU Compiler Collection

**Module:** languages/gcc/6.3.0

**Path** /shared/software/languages/gcc/6.3.0

**Date** January 24, 2017

#### 5.3.1 Packages included

**Main Package**

- gcc-6.3.0

**Dependencies for GCC**

- gmp-4.3.2
- isl-0.15
- mpc-0.8.1
- mpfr-2.4.2

**Dependencies to test GCC**

- autogen-5.18.7
- libunistring-0.9.7
- libffi-3.2.1

- gc-7.2
- guile-2.0.13

#### Development tools for build packages

- autoconf-2.69
- automake-1.15
- m4-1.4.18
- libtool-2.4.6

#### Convenience libraries included

\* gsl-2.3 (GNU Scientific Library) \* sqlite-autoconf-3160200 (SQLite is a self-contained SQL database engine) \* xz-5.2.3 (LZMA compression)

### 5.3.2 Older Modules it obsoletes

\* compilers/gcc/4.8.2 \* compilers/gcc/4.9.0 \* compilers/gcc/5.3.0 \* libraries/gsl/2.1 (Integrated for convenience) \* libraries/sqlite/3.9.2

## FOR ADMINISTRATORS

### 6.1 Documentation on Sphinx

#### 6.1.1 Creation

1. Create a Repository called  
WVUResearchComputing.github.io
- 2.

#### 6.1.2 Changing the documents

These are the steps to create a working environment for introducing changes to the documentation. Create one folder for both “sphinx” and “master” branches:

```
mkdir DOCS
cd DOCS
git clone --single-branch -b sphinx https://github.com/WVUResearchComputing/WVUResearchComputing.git
git clone --single-branch -b master https://github.com/WVUResearchComputing/WVUResearchComputing.git
```

After this commands, the DOCS folder will contain two subfolders, “sphinx” and “master”. The branch “sphinx” has the sources and “master” the generated web pages.

Editing the documentation is basically adding or modifying the “.rst” files in the subfolder “texts”. To compile the documentation execute:

```
make html
```

## DOMAIN SPECIFIC DETAILS

### 7.1 Engineering: ANSYS Products

#### 7.1.1 Log in to Spruce

Enter on Spruce with X11 forwarding, at least on Linux it is with

```
ssh -X <USERNAME>@spruce.hpc.wvu.edu
```

On Windows you can MobaXTerm and the program will give you X11 forwarding too

You can test the X11 forwarding with:

```
xeyes
```

A small window with two eyes will pop up on your screen, execute CTRL-C to exit The test will just prove that a window can be created on your client machine.

#### 7.1.2 Create an interactive job

Ask for an interactive job with X11 Forwarding enabled, I am using “debug” queue, change accordingly

```
qsub -X -I -q debug
```

Wait around 2 minutes to get a compute node allocated for you Different queues could have different response times before a compute node can be allocated to you. In general use “standby” on Spruce for Interactive jobs to run during a 4-hour timeframe.

#### 7.1.3 Load the module for ANSYS Fluids or Structures

There are two modules corresponding to equal number of ANSYS Suites of packages

```
module load ansys/fluids_18.1
```

and

```
module load ansys/structures_18.1
```

You can load one or another or both, they use the same MPI Runtime Libraries so they are compatible to each other.

## 7.1.4 Executing the ANSYS package of your choice

Most commands will be directly accessible to you, you do not need to enter the full path

```
fluent
```

The fluent window opens and on the lower right corner you will see:

```
/shared/software/ansys/fluids_181/ansys_inc/v181/fluent/fluent18.1.0/bin/fluent -r18.1.0 3d -alnamd64
Starting /shared/software/ansys/fluids_181/ansys_inc/v181/fluent/fluent18.1.0/lnamd64/3d/fluent.18.1
```

```
Welcome to ANSYS Fluent Release 18.1
```

```
Copyright 2017 SAS IP, Inc. All Rights Reserved.
```

```
Unauthorized use, distribution or duplication is prohibited.
```

```
This product is subject to U.S. laws governing export and re-export.
```

```
For full Legal Notice, see documentation.
```

```
Build Time: Apr 11 2017 14:22:58 EDT Build Id: 10162
```

```
-----
This is an academic version of ANSYS FLUENT. Usage of this product
license is limited to the terms and conditions specified in your ANSYS
license form, additional terms section.
-----
```

```
Cleanup script file is /gpfs/home/gufranco/cleanup-fluent-sllc0001.hpc.wvu.edu-48370.sh
```

You can try also ANSYS/Forte

```
forte.sh
```

A window with 3 big buttons appear, click Simulate

The Full Window for Forte appears.

In the case of ANSYS Structures 18.1 all that you have to do after loading the module is to open the Workbench:

```
runwb2
```

## 7.2 Engineering: ANSYS/Forte

### 7.2.1 Overview

ANSYS Forte is the only CFD simulation package for internal combustion engines that incorporates proven ANSYS Chemkin-Pro solver technology – the gold standard for modeling and simulating gas phase and surface chemistry. Forte includes state-of-the-art automatic mesh generation (AMG), including solution adaptive mesh Refinement (SAM) and geometry-based adaptive mesh refinement (AMR). While legacy engine-combustion CFD simulations utilize chemistry solvers that are too slow to handle the chemistry details required for accurate predictions of ignition and emissions, Forte enables the use of multicomponent fuel models to combine with comprehensive spray dynamics – without sacrificing simulation time-to-solution.

## 7.2.2 Features

- Automatic mesh generation that eliminates weeks of effort typically spent on manual mesh preparation
- Embedded Chemkin-Pro solver technology that provides the computational speed required for predictive engine simulations
- True multicomponent fuel-vaporization models that enable a self-consistent representation of the physical spray and the kinetics for accurate prediction of fuel effects
- Advanced spray models that dramatically reduce grid and time-step dependency when compared to existing approaches
- The ability to track soot particle nucleation, growth, agglomeration and oxidation without a compute-time penalty to predict particle size and number

## 7.2.3 Tutorial

This tutorial will describe the steps needed to complete the execution of the first examples from the tutorial documentation.

### Connect to Mountaineer

```
ssh -X username@mountaineer.hpc.wvu.edu
```

The ‘-X’ is necessary to get access to the graphical interface needed to prepare the simulation.

### Load the Module

```
module load ansys/forte/17.2
```

Forte initial GUI

### Execute the ANSYS/Forte GUI

First, we need to create a directory for the simulation we want to perform. Lets create for example a directory called ‘forte’ and inside create a subdirectory for our first simulation. The first simulation will be ‘SectorMesh’

```
mkdir $HOME/forte
mkdir $HOME/forte/SectorMesh
```

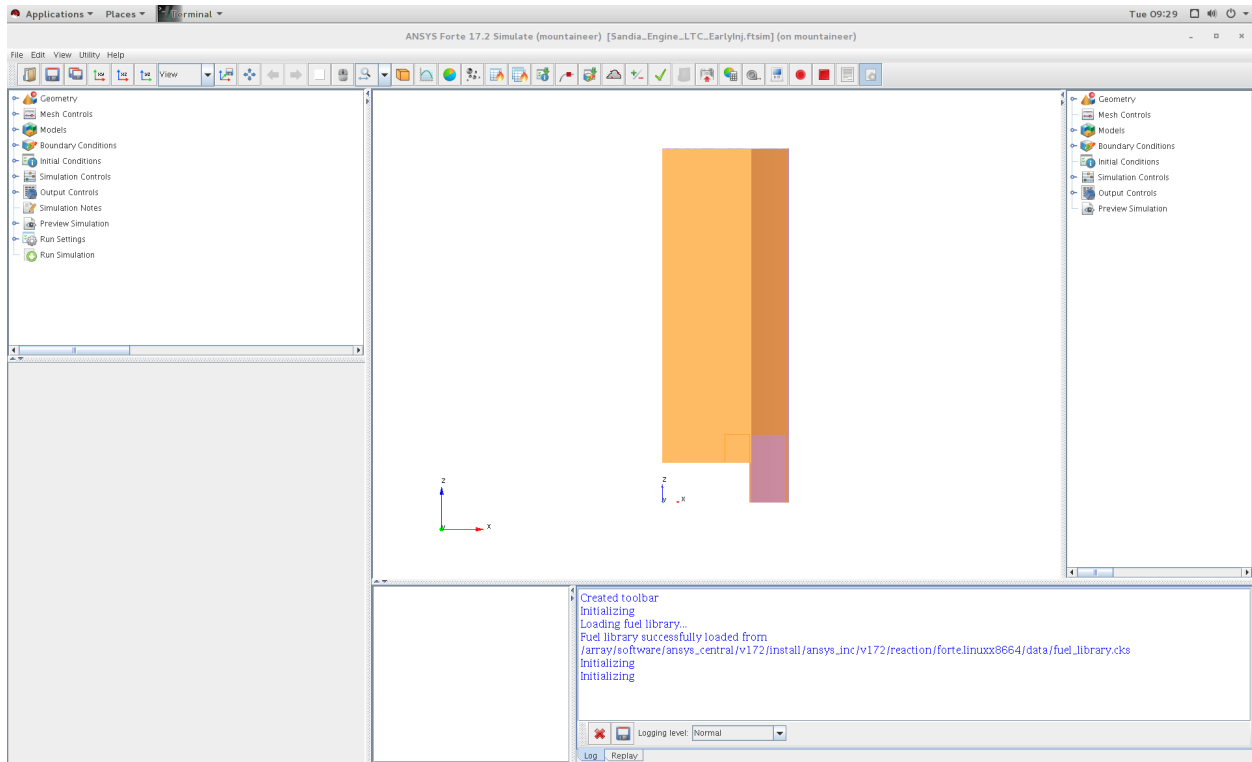

The Official Tutorials for Forte are in ‘/software/ansys\_central/Forte\_Tutorials’, we will copy Sandia\_Engine\_LTC\_EarlyInj.ftsim to the directory we just create.

```
cp /software/ansys_central/Forte_Tutorials/Quick-start_SectorMesh/Sandia_Engine_LTC_EarlyInj.ftsim $
```

We will use this input for this tutorial, now, we can launch the GUI using the command:

```
forte.sh &
```

The ‘&’ will free your terminal so you can enter more commands there. Otherwise you will need another terminal when we actually launch the simulation. Once you execute ‘forte.sh’ you should get a window with 3 buttons: Simulate, Monitor and Visualize.

## Simulate Window

Click on Simulate button and open the file ‘Sandia\_Engine\_LTC\_EarlyInj.ftsim’ You should get the ‘Simulate’ window. Click on Menu ‘File - Open...’ and search for the input file ‘Sandia\_Engine\_LTC\_EarlyInj.ftsim’, in your directory ‘forte/SectorMesh’. The main window will display the mesh, you get on the log panel messages such

```
Loading fuel library...
Fuel library successfully loaded from
/array/software/ansys_central/v172/install/ansys_inc/v172/reaction/forte.linuxx8664/data/fuel_lib
Initializing
Initializing
```

Now we are ready to create the scripts and run the simulation on Mountaineer

## Simulate Window

### Prepare simulation files

Click on “Run Simulation” in the tree panel. The options for running the simulation appear in a panel down the tree panel. There are several options that we need to change. Select Parallel instead of Serial. Change to ‘Prepare Batch Scripts Only’. There is also a field under ‘MPI Args’, change that to the number of cores that you want use. 8 could be a reasonable number for this small simulation. Click the Green triangle under ‘Prepare’.

Now, we need to go back to the terminal and see the effects of preparing the simulation runs. A new directory is created called ‘Sandia\_Engine\_LTC\_EarlyInj.analysis’. Inside that directory there are one file called ‘Sandia\_Engine\_LTC\_EarlyInj.ftsimsim’ and a directory called ‘Nominal’ The contents of Nominal are:

```
chem.inp
chem.out
fuel_lib_chem.inp
fuel_lib_chem.out
fuel_lib_gas.asc
fuel_lib_xml.out
gas.asc
PREPARED
run_env.bat
run_env.sh
run_mpi.bat
run_mpi.sh
Sandia_Engine_LTC_EarlyInj.ftsimsim
therm.dat
xml.out
```

Now, we need to prepare the submission script for Mountaineer Go to ‘Nominal’ directory and create the script file

```
cd $HOME/forte/SectorMesh/Sandia_Engine_LTC_EarlyInj.analysis/Nominal
cat <<EOF >runjob.pbs
#!/bin/sh

#PBS -N FORTE
#PBS -l nodes=1:ppn=8,walltime=01:00:00
#PBS -m ae
##PBS -M username@mail.wvu.edu
#PBS -q hour

module load ansys/forte/17.2

cd $PBS_O_WORKDIR
sh run_mpi.sh
EOF
```

You should remove one # from ##PBS -M username@mail.wvu.edu and change the email address in order to receive notifications when job finish. We are requesting 1 hour (walltime=01:00:00), using one node (nodes=1) and creating 8 MPI processes (ppn=8). Those values should be adapted to the needs of your job. If you ask for more than one hour you must change also the queue where you are submitting the jobs (#PBS -q hour), consider for example queues 'day' and 'week' if your jobs need more time to complete.

Submit the job with

```
qsub runjob.pbs
```

The job is submitted to the queue, it will start running when enough resources are free to start executing your job. You can always monitor the status of your submission with

```
qstat -u username
```

Once your job simulation start execution, you can monitor the progress by looking at the MONITOR file, one way of doing that is using tail command.

```
tail -f MONITOR
```

You should see something like

7852	116.38	3.908E-02	5.000E-06	Maximum reached	953.80	330.53	0.4565	9.79E+00

The best way of continue from here is to copy those files back to your workstation for post-processing and analysis.

You can however continue on Mountaineer and start analysing the results of the simulation. On the initial window with three buttons, click on Monitor and open the project file. The image on the left, you can get see basic plots of temperature and pressure as a function of crank angle. By clicking on the Visualize button you get a big window where you can see visualizations of the fluids inside the crank.

asdsadsd

## 7.3 Engineering: Running OpenFOAM simple tutorial

### 7.3.1 Load modules

OpenFOAM was compiled with gcc 5.3.0 and openMPI 1.6.5. These modulefiles will need to be loaded to run OpenFOAM.

```
$> module load compilers/gcc/5.3.0 mpi/openmpi/1.6.5 libraries/openfoam/3.0+
```

### 7.3.2 Run OpenFOAM

Below is a sample tutorial given by OpenFOAM to show how to run OpenFOAM on our systems. The commands below will initiate an interactive job on the debug queue, and execute the openFoam tutorial.

```
$> debug
```

```
$> module load compilers/gcc/5.3.0 libraries/openfoam/3.0+
$> mkdir -p $FOAM_RUN
$> run
$> cp -r $FOAM_TUTORIALS/incompressible/simpleFoam/pitzDaily ./
$> mv pitzDaily/* .
$> blockMesh
$> simpleFoam
```

### 7.3.3 Using ParaView with OpenFoam

Visualization of openFoam output can be executed from the head node. To use paraFoam, make sure you have logged in with X11 forwarding enabled.

```
$> module load compilers/gcc/5.3.0 libraries/openfoam/3.0+ visualization/paraview
$> run
$> paraFoam
```

## 7.4 Bioinformatics: Conda and BioConda

**Conda** is an open source package management system and environment management system that runs on Windows, macOS and Linux. Conda quickly installs, runs and updates packages and their dependencies. Conda easily creates, saves, loads and switches between environments.

We have Conda installed on Spruce, all that you have to do to enable the conda environment is to execute:

```
source /shared/software/miniconda3/etc/profile.d/conda.sh
```

**Bioconda** is a channel for the conda package manager specializing in bioinformatics software. Bioconda offers a repository of more than 4000 bioinformatics packages

In the future most packages in bioinformatics will be offered via Bioconda instead of independent modules. That allow us to keep packages consistent and updated.

To get a better idea about using bioconda and the packages provided here we prepare a basic tutorial on its usage on Spruce.

### 7.4.1 Preparing the environment

On spruce:

You can load the module, but it only remembers you the script that needs to be sourced to operate with Bioconda

```
module load genomics/bioconda
```

In fact the conda environment is enable only when you actually source the script

```
source /shared/software/miniconda3/etc/profile.d/conda.sh
```

### 7.4.2 Knowing which environments are available

By the time of writting this tutorial Spruce offers three environments centrally installed:

```
$ conda info --envs
# conda environments:
#
                                /scratch/gufranco/bowtie2
base                            * /shared/software/miniconda3
qiime2-2018.8                   /shared/software/miniconda3/envs/qiime2-2018.8
tpd0001                         /shared/software/miniconda3/envs/tpd0001
```

### 7.4.3 Activating an existing environment

Suppose that you want to use the environment called “tpd0001”, to achieve that execute

```
conda activate tpd0001
```

### 7.4.4 Deactivating the current environment

```
conda deactivate
```

### 7.4.5 Creating a new environment from a YML file

You can create your own environment, one easy way of doing that is via a YML file that describes the channels and packages that you want on your environment. The YML file will look like this, for a simple case when you want one env for bowtie2 (bowtie2.yml)

```
name: spruce-bowtie2
channels:
  - bioconda
  - conda-forge
  - defaults
dependencies:
  - bowtie2
```

Another example is this YML file for installing a curated set of basic genomics codes that requires just a few dependencies. (biocode.yml)

```
name: biocode
channels:
  - bioconda
  - conda-forge
  - defaults
dependencies:
  - bamtools
  - bcftools
  - bedtools
  - hmmer
  - muscle
  - raxml
  - samtools
  - sga
  - soapdenovo-trans
  - soapdenovo2
  - sra-tools
  - vcftools
  - velvet
```

To create an environment from those YML files you can select one location on your scratch folder

```
conda env create -p $SCRATCH/bowtie2 -f bowtie2.yml
```

or for the biocode.yml

```
conda env create -p $SCRATCH/biocode -f biocode.yml
```

By default, new environments are created inside your \$HOME folder on \$HOME/.conda

### 7.4.6 Listing the packages inside one environment

Bowtie2 has a number of dependencies (19 dependencies for 1 package) Notice that only bowtie2 comes from bioconda channel. All other packages are part of conda-forge, a lower level channel.

```
$ conda activate $SCRATCH/bowtie2
$ conda list
# packages in environment at /scratch/gufranco/bowtie2:
#
# Name                      Version                Build  Channel
bowtie2                     2.3.4.2                py36h2d50403_0  bioconda
bzip2                       1.0.6                  h470a237_2      conda-forge
ca-certificates             2018.8.24              ha4d7672_0      conda-forge
certifi                     2018.8.24              py36_1          conda-forge
libffi                      3.2.1                  hfc679d8_5      conda-forge
libgcc-ng                   7.2.0                  hdf63c60_3      conda-forge
libstdcxx-ng                7.2.0                  hdf63c60_3      conda-forge
ncurses                     6.1                    hfc679d8_1      conda-forge
openssl                     1.0.2p                 h470a237_0      conda-forge
perl                        5.26.2                 h470a237_0      conda-forge
pip                          18.0                   py36_1          conda-forge
python                      3.6.6                  h5001a0f_0      conda-forge
readline                    7.0                    haf1bffa_1      conda-forge
setuptools                  40.2.0                 py36_0          conda-forge
sqlite                       3.24.0                 h2f33b56_1      conda-forge
tk                           8.6.8                  0               conda-forge
wheel                       0.31.1                 py36_1          conda-forge
xz                           5.2.4                  h470a237_1      conda-forge
zlib                         1.2.11                 h470a237_3      conda-forge
```

### 7.4.7 Using a conda environment in a submission script

To execute software in a non-interactive job you need to source the main script, activate the environment that contains the software you need, execute the the scientific code and deactivate the environment. This is a simple example showing that for bowtie2

```
#!/bin/bash

#PBS -N MY_JOB
#PBS -q standby
#PBS -j oe
#PBS -l nodes=1:ppn=2

source /shared/software/miniconda3/etc/profile.d/conda.sh
conda activate $SCRATCH/bowtie2

bowtie2 .....

conda deactivate
```

### 7.4.8 Deleting a environment

To remove an environment you can just execute this command.

```
conda remove --all -p $SCRATCH/bowtie2
```

## 7.4.9 More documentation

Conda Documentation

Available packages — Bioconda documentation

## 7.5 Bioinformatics: Using Bowtie2

This tutorial will show how to use Job Arrays to manage the alignment of a big pair of sequencing data.

For the purpose of the tutorial, consider that you receive a pair of files like this:

```
Estrogen_24_1.clean.fq
Estrogen_24_2.clean.fq
```

And you have a reference like:

```
Oncorhynchus_mykiss_chr.fa
```

This tutorial will show you how to do the alignments concurrently by splitting the fq files and use BSseeker and bowtie2 for the alignment. When the job is done we use samtools to merge the results in a single BAM file.

### 7.5.1 1. Transfer the files

The files referred above are really big, the first step is to send those files to the cluster. The files are too big to store them on your home account so you have to use the scratch space. There are two ways of sending the files to the cluster. Using command line tools like rsync or using the Globus connector to send those files from your computer to the cluster.

If you are using Linux or Mac on your side, the command to send those files will be,

```
rsync -av Estrogen_24_1.clean.fq Estrogen_24_2.clean.fq Oncorhynchus_mykiss_chr.fa [username@localhost:~]$
```

Globus is another alternative, follow the instructions: [Transferring\_Files]

### 7.5.2 2. Preparing folders

It is always good practice to keep some structure on the files that you will use on your research. We suggest creating a few directories, for the references, for the big sequence fq files, output and temporary files.

```
cd /scratch/[username]
mkdir REFS OUTPUT TMP WGBS
```

Now we need to move the big fq files to WGBS and the reference to REFS

```
mv Estrogen_24_1.clean.fq Estrogen_24_2.clean.fq WGBS
```

```
mv Oncorhynchus_mykiss_chr.fa REFS
```

### 7.5.3 3. Splitting the files

Our first couple of jobs consists on splitting the two big fq files. We can get an idea about how big they are by counting the number of lines

```
$ wc -l WGBS/Estrogen_24*.fq
“ 670407612 WGBS/Estrogen_24_1.clean.fq“
“ 670407612 WGBS/Estrogen_24_2.clean.fq“
“ 1340815224 total“
```

They have the same number of lines, more than 670 million lines. It is important to realize that you cannot simply cut those files arbitrarily. Each 4 lines makes a block of information that cannot be splitted

```
@ST-E00144:275:HW5VJCCXX:7:1101:2564:1327 1:N:0:NTGAGCCA
```

```
NGAGAATATTTTTGGTTATTTTTTTTAGTTTTTGATTGGAAGATTTATTAGATAGAGAATATTGTTGGTTATTTTTTTTAGTTTTGAT
+
#AAAAA7-7A
```

1. `#!/bin/bash`
2. `PBS -N SPLIT`
3. `PBS -l nodes=1:ppn=1`
4. `PBS -l walltime=4:00:00`
5. `PBS -m ae`
6. `PBS -q standby`

```
cd $PBS_O_WORKDIR
```

```
mkdir -p WGBS/split echo $file split -d -a 3 -l 2400000 WGBS/${file} WGBS/split/${file}_
```

The submission script will create a job called “SPLIT” using one node (nodes=1) and one process per node (ppn=1). We set a walltime in 4 hours, the limit for the standby queue. We suppose to submit this job from the scratch directory. So the first step is to move into that directory using `cd $PBS_O_WORKDIR`, we create a folder for the split files inside WGBS. The split command:

```
split -d -a 3 -l 2400000 WGBS/${file} WGBS/split/${file}_
```

The split command will create split files with 3 digits (-a 3), starting from 000. It will split every 2.4 million lines, the file indicated under the file variable that will use next. All those split files will be stored at WGBS/split using the same name as the original but with a suffix being underscored “\_” and the 3 digits mentioned before.

We submit the jobs like this:

```
qsub runjob_split.pbs -v file=Estrogen_24_1.clean.fq
qsub runjob_split.pbs -v file=Estrogen_24_2.clean.fq
```

Those two jobs takes around 30 minutes in one of our compute nodes. Once that splitting is complete you can see many files populating the WGBS/split folder. Those are the files we will use in our next step

## 7.5.4 4. Using BSseeker2

The webpage of the project is here: [1](http://pellegrini.mcdb.ucla.edu/BS_Seeker2/) Copy the link and download the software, at the time of writing this (April 2017), the latest version was 2.1.0 and the download URL was:

```
wget ``\ ```http://pellegrini.mcdb.ucla.edu/BS_Seeker2/BSseeker2_v2.1.0.tar.bz
<http://pellegrini.mcdb.ucla.edu/BS_Seeker2/BSseeker2_v2.1.0.tar.bz>`__
```

Once you have the code, uncompress it with:

```
tar -jxvf BSseeker2_v2.1.0.tar.bz
```

The submission script (runjob.pbs) will look like:

```
#!/bin/sh

#PBS -N ALIGN_${PBS_ARRAYID}
#PBS -l nodes=1:ppn=4
#PBS -l walltime=04:00:00
#PBS -l feature='!smp'
#PBS -m ae
#PBS -q standby
#PBS -t 0-279

module load compilers/python/2.7.13
module load genomics/bowtie2

if [ ${PBS_ARRAYID} -lt 10 ]
then
    JAID=00${PBS_ARRAYID}
elif [ ${PBS_ARRAYID} -lt 100 ]
then
    JAID=0${PBS_ARRAYID}
else
    JAID=${PBS_ARRAYID}
fi

SCRATCH=/scratch/[username]
REFS=${SCRATCH}/REFS
WGBS=${SCRATCH}/WGBS
TEMP=${SCRATCH}/TMP
OUTP=${SCRATCH}/OUTPUT
FQ1=${WGBS}/split/Estrogen_24_1.clean.fq_${JAID}
FQ2=${WGBS}/split/Estrogen_24_2.clean.fq_${JAID}
FA=${REFS}/Oncorhynchus_mykiss_chr.fa

echo 'Job start: '`date`
cd $PBS_O_WORKDIR
cd BSseeker2_v2.1.0

mkdir -p ${TEMP}

python bs_seeker2-align.py -1 $FQ1 -2 $FQ2 -m 3 --aligner=bowtie2 -o ${OUTP}/Estrogen_24.${JAID}.ali

echo 'Job complete: '`date`
```

There a number of details to mention here. We cut the fq files in 2.4 million lines in order to be sure we can process them in our 4 hour walltime. The Job Array start with 0 and ends at 279. This piece of code ensures 3 digit numbers filling with leading zeros as needed:

```
if [ ${PBS_ARRAYID} -lt 10 ]
then
    JAID=00${PBS_ARRAYID}
elif [ ${PBS_ARRAYID} -lt 100 ]
then
    JAID=0${PBS_ARRAYID}
else
    JAID=${PBS_ARRAYID}
fi
```

The rest of the script defines locations for references, the split files and output. Finally it launches BSseeker2. Remember to replace [username] with your username.

```
SCRATCH=/scratch/[username]
REFS=${SCRATCH}/REFS
WGBS=${SCRATCH}/WGBS
TEMP=${SCRATCH}/TMP
OUTP=${SCRATCH}/OUTPUT
FQ1=${WGBS}/split/Estrogen_24_1.clean.fq_${JAID}
FQ2=${WGBS}/split/Estrogen_24_2.clean.fq_${JAID}
FA=${REFS}/Oncorhynchus_mykiss_chr.fa

echo 'Job start: '`date`
cd $PBS_O_WORKDIR
cd BSseeker2_v2.1.0

mkdir -p ${TEMP}

python bs_seeker2-align.py -1 $FQ1 -2 $FQ2 -m 3 --aligner=bowtie2 -o ${OUTP}/Estrogen_24.${JAID}.ali

echo 'Job complete: '`date`
```

The command bowtie creates several threads, to ensure enough cores we set ppn=4.

### 7.5.5 4. Checking completion for all jobs

Sometimes jobs failed for one reason or another. It could be hard to check the output one by one to see if some job needs to be executed again. This small python script could help you with that task (BSresubmit.py)

```
#!/usr/bin/env python

import argparse
import os

if __name__ == '__main__':

    parser = argparse.ArgumentParser(description='Process some integers.')
    parser.add_argument('-output_directory', '-d', metavar='PATH', type=str, help='Directory for search')
    parser.add_argument('-prefix', '-p', metavar='PREFIX', type=str, help='Filenames must be prefix+number')
    parser.add_argument('-suffix', '-s', metavar='SUFFIX', type=str, help='Filenames must be prefix+number+suffix')
    parser.add_argument('-min_split_number', '-m', metavar='N', type=int, help='min number of split')
    parser.add_argument('-max_split_number', '-n', metavar='N', type=int, help='max number of split')

    args = parser.parse_args()
```

```
failures=[]
for i in range(args.min_split_number, args.max_split_number+1):
    filename="%s%s%s%03d%s" % (args.output_directory,os.sep, args.prefix, i, args.suffix)
    if not os.path.isfile(filename):
        failures.append(i)
        continue

    rf=open(filename)
    data=rf.readlines()
    if not 'END' in data[-1]:
        failures.append(i)

if len(failures)==0:
    print("All the jobs are complete in the range")
else:
    print("Some jobs need to be resubmitted:")
    print(failures)
```

In order to check if all the jobs are complete execute:

```
“ ./BSresubmit.py -d OUTPUT -p Estrogen_24. -s .align.bs_seeker2_log -n 279 “
```

Once you have all the data you can move forward and merge the files using samtools:

## 7.6 Matlab: Running Matlab scripts on a HPC cluster

This simple tutorial explains how to use Matlab without launching the graphical interface and using the submission script.

### 7.6.1 Executing Matlab scripts

Consider this simple script that computes first and second derivatives of a function to find extrema and inflection points of a given function.

derivatives.zip

You can create a directory for this, for example MATLAB and uncompress there the file derivatives.zip:

```
unzip derivatives.zip
```

It will uncompress a file called “derivatives.m”, that is the actual matlab code that we would like to execute on the cluster.

The submission script is very simple, for this example we will use a single core:

```
#!/bin/sh

#PBS -N MATLAB
#PBS -l nodes=1:ppn=1
#PBS -l walltime=1:00:00
#PBS -m ae
#PBS -q debug

module purge
module load statistics/matlab/2014a
```

```
cd $PBS_O_WORKDIR
matlab -nodisplay -r derivatives
```

Store this lines into a file called runjob.pbs

This submission script is telling the PBS system that we are creating a job called “MATLAB”, that will use one node (nodes=1) and one core per node (ppn=1), during one hour (walltime=1:00:00). I will be notified by email (-m ae) either for the job being aborted or ended. The queue were the job is submitted is called “debug” but you can also choose other queues such as “comm\_mmem\_week” or “comm\_mmem\_day”. that will offer extended periods of time.

The lines module purge and module load statistics/matlab/2014a will prepare the environment for executing Matlab on the HPC cluster.

Finally, the script will execute the matlab script “derivatives.m” without opening the graphical user interface (GUI). Notice that you should execute matlab -nodisplay -r derivatives without adding the “.m”. Matlab will always search for a file called “derivatives.m”

You submit the job from the command line executing:

```
$qsub runjob.pbs
987788.srih0001.hpc.wvu.edu
```

You should get like above the JobID, an identifier that allow you to keep track of your execution. You can monitor the execution like this: When in queue, ie, waiting for execution:

```
$ qstat 987788
```

Job ID	Name	User	Time Use	S	Queue
987788.srih0001	MATLAB	gufranco	0	Q	debug

When running:

```
$ qstat 987788
```

Job ID	Name	User	Time Use	S	Queue
987788.srih0001	MATLAB	gufranco	0	R	debug

When finished:

```
$ qstat 987788
```

Job ID	Name	User	Time Use	S	Queue
987788.srih0001	MATLAB	gufranco	00:00:07	C	debug

When the job concludes, you will get the files:

```
derivatives.fig
derivatives.m
derivatives.png
MATLAB.e987788
MATLAB.o987788
runjob.pbs``
```

The figures were generated and save on the same folder you submit your job. The output of your execution is stored at MATLAB.o987788

```
< M A T L A B (R) >
Copyright 1984-2014 The MathWorks, Inc.
R2014a (8.3.0.532) 64-bit (glnxa64)
```

Figure 7.1: derivatives.png

```
ans =
```

```
1.8651543689917122385037075917613  
0.57871842655441748319601085860196
```

## 7.6.2 Using the Matlab Compiler

The first step is to load matlab to get access to its executables:

```
module load statistics/matlab/2014a
```

Prepare the compilation environment with:

```
$ mbuild -setup``  
MBUILD configured to use 'gcc' for C language compilation.``
```

To choose a different language, execute one from the following:``

```
mex -setup C++ -client MBUILD ``  
mex -setup FORTRAN -client MBUILD``
```

You cannot compile matlab scripts that uses the symbolic toolbox

[https://www.mathworks.com/products/ineligible\\_programs.html](https://www.mathworks.com/products/ineligible_programs.html)

So we will use another script for this tutorial.

mandelbrot.zip

After uncompress the file “mandelbrot.m”:

```
mcc -m mandelbrot.m
```

It takes a while, when finished you will get some extra files:

```
mandelbrot  
run_mandelbrot.sh
```

The submission script changes to:

```
#!/bin/sh  
  
#PBS -N MATLAB  
#PBS -l nodes=1:ppn=1  
#PBS -l walltime=1:00:00  
#PBS -m ae  
#PBS -q debug  
  
module purge  
module load statistics/matlab/2014a  
  
cd $PBS_O_WORKDIR  
./run_mandelbrot.sh /shared/software/MATLAB/R2014a
```

After submit the job with:

```
qsub runjob.pbs
```

You get the results on “MATLAB.o#####” with the corresponding JobID

Figure 7.2: Mandelbrot fractal generated from Matlab

## 7.7 Visualization: VisIt

From: <https://wci.llnl.gov/simulation/computer-codes/visit>

VisIt is an Open Source, interactive, scalable, visualization, animation and analysis tool. From Unix, Windows or Mac workstations, users can interactively visualize and analyze data ranging in scale from small (<101 core) desktop-sized projects to large (>105 core) leadership-class computing facility simulation campaigns. Users can quickly generate visualizations, animate them through time, manipulate them with a variety of operators and mathematical expressions, and save the resulting images and animations for presentations. VisIt contains a rich set of visualization features to enable users to view a wide variety of data including scalar and vector fields defined on two- and three-dimensional (2D and 3D) structured, adaptive and unstructured meshes. Owing to its customizable plugin design, VisIt is capable of visualizing data from over 120 different scientific data formats ([see this partial list](#)).

### 7.7.1 Introduction

VisIt is available on Spruce Knob in a client server model. In order to utilize VisIt, you will need to install a local (client) copy of VisIt on your workstation/laptop. This will allow you to visualize your data on your workstation but be able to run VisIt against data stored in Spruce Knob filesystems. For any back-end processing that VisIt might need, it can also take advantage of Spruce Knob's processing power.

### 7.7.2 Client Installation

By the time this wiki page was reviewed (July 19, 2017) the latest version available was 2.12.3 released on June, 2017. Client executables are available from 1. Be sure to read the install notes for your particular installation need. In most cases you will use the 64 bit version appropriated for your OS (Windows, Mac or Linux)

**Note:** You will need to download a version that matches an available version on Spruce Knob. Currently we have 2.12.2 released on April 2017. If both client and server are 2.12.x they should work correctly

### 7.7.3 Running VisIt in the Client/Server Model

After successfully installing VisIt on your workstation, you can run through the following steps to start using it on in connection with Spruce Knob. **Note:** The following setups up VisIt to run in Parallel Mode but the same instructions apply for a serial run. When you enter the number of processors you need during the submission process, just select 1.

#### Configuring Client to use Spruce Knob as a Server

- Execute 'visit':

You can just use the icon or the command line. The command line is useful to identify problems during the first configuration of VisIt to use Spruce as server. On MacOS the command line is accessible with:

“ /Applications/VisIt.app/Contents/Resources/bin/visit “

- Go-to **Options** menu and select **Host Profiles ...**.
- In the Host profiles window, select **New** and enter the following information on the **Host Settings** tab.
- Select the **Launch Profile** tab and select **New Profile** and enter the following information in the **Settings** sub tab.
- Select the **Parallel** sub tab and enter the following information. Note, you can use a different **Queue** setting but in most cases standby should be sufficient unless you suspect your task will last longer than 4 hours.

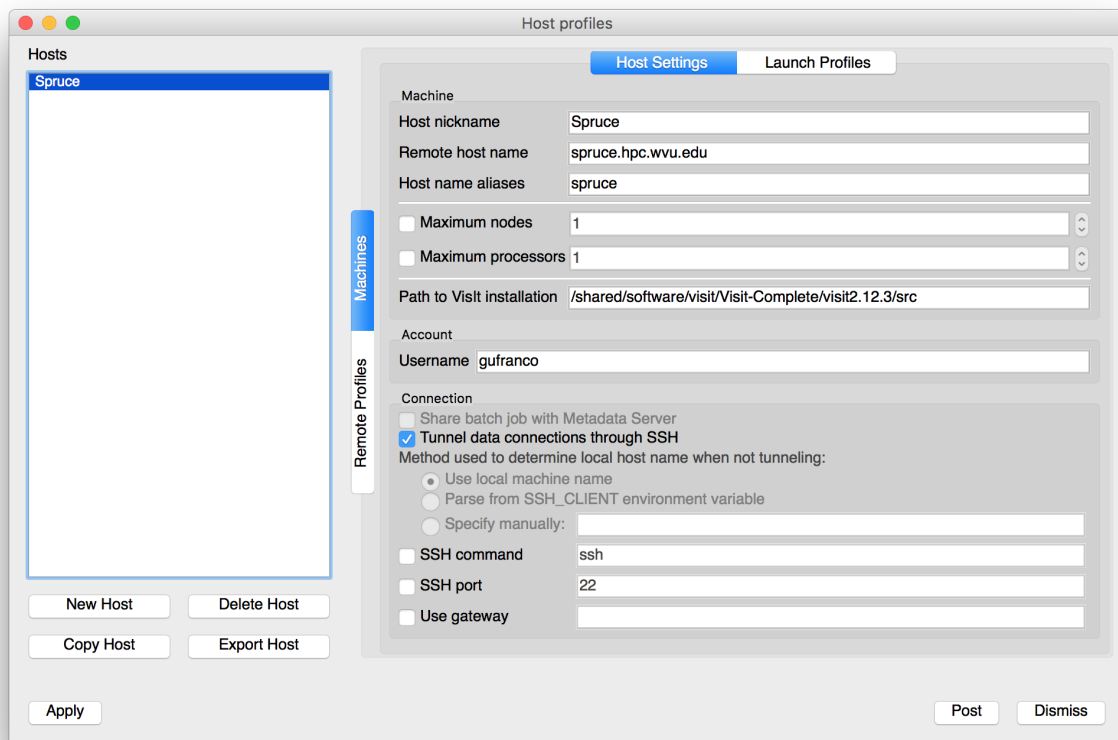

Figure 7.3: host\_settings.png

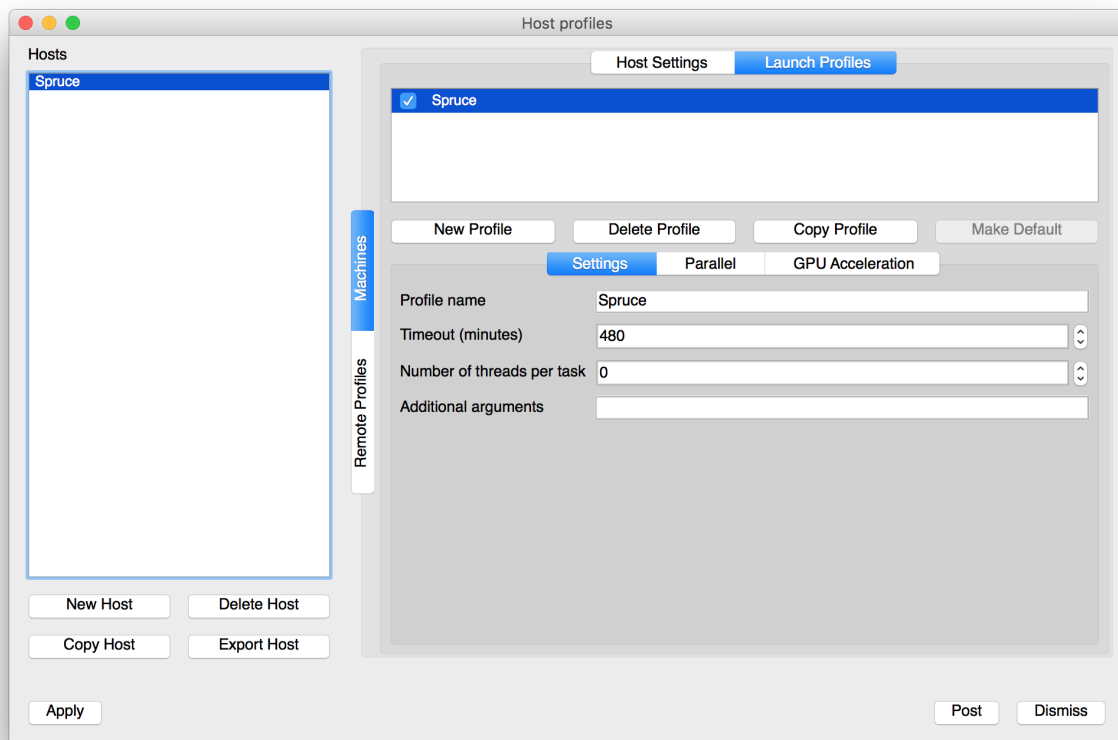

Figure 7.4: launch\_profiles.png

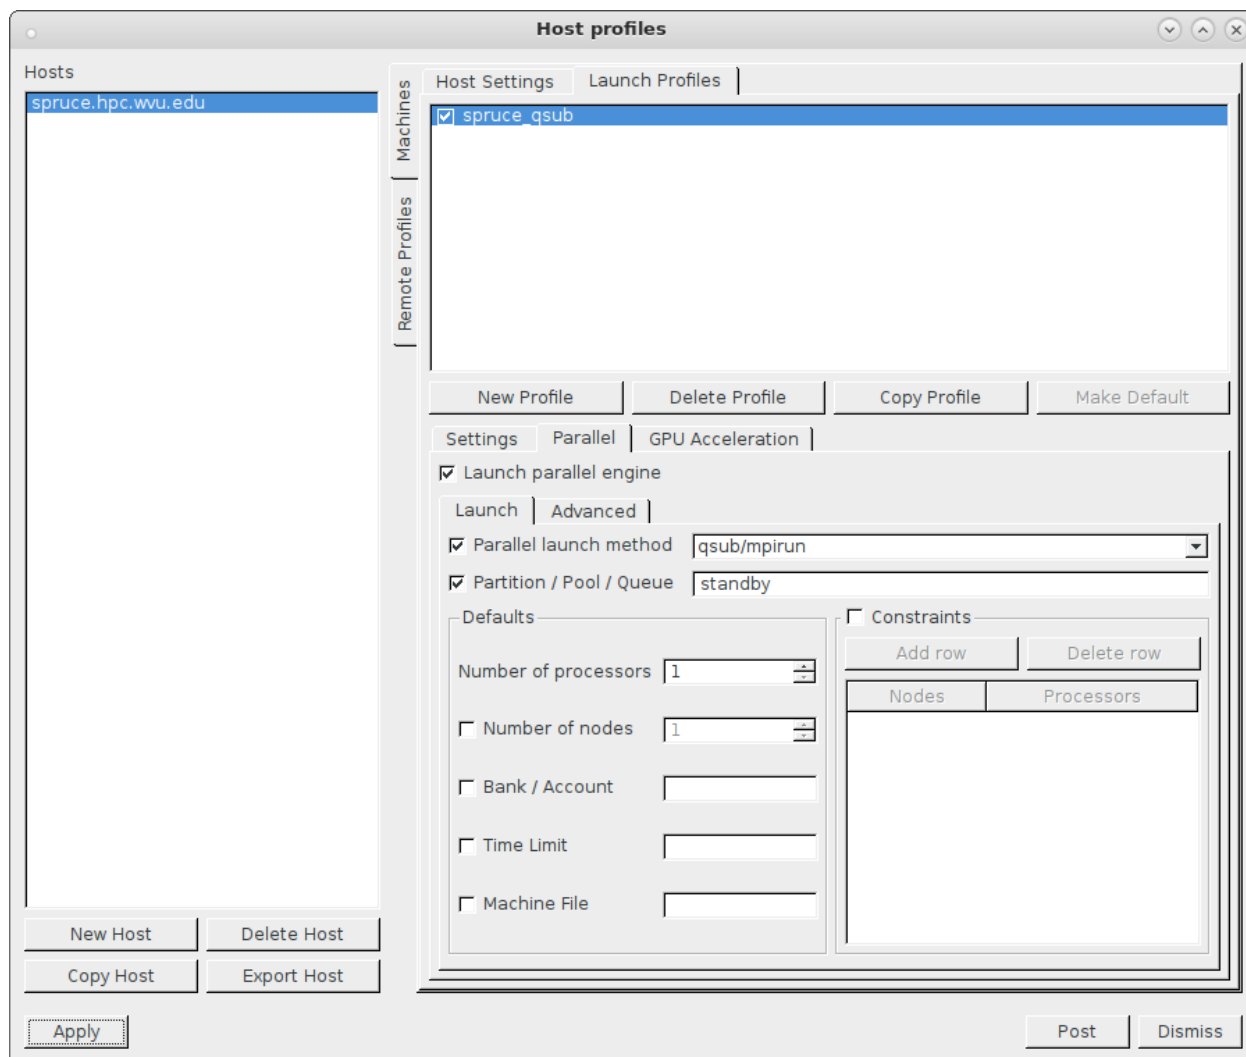

Figure 7.5: parallel\_options.png

- Within the **Parallel** sub tab, select the **Advanced** sub tab, and enter **module load visualization/visit/2.10.2** in the **Sublauncher pre-mpi command** field. Screen should look as follows:

Figure 7.6: parallel\_advanced.png

- Select **Apply** in the lower left corner.
- Select **Options** and **Save Settings** from the menu on the main VisIt user interface.

## Connect your client to Spruce Knob

- If VisIt is not already running on your workstation, start it by executing **visit** on the command line.
- Select **Open** under the **Sources** section.
- Select **spruce.hpc.wvu.edu** in the Host Section and enter your password when prompt. You should see screen similar to the following.

- You should now see the contents of your home directory and ready to use VisIt on your local data.

## Visualize an Example VisIt Dataset

Note: This assumes you have already connected to Spruce Knob from your client workstation following the instructions from the previous section.

- Change **Path** to `/shared/software/visit/latest/data` and select **globe.silo**.

Figure 7.7: example\_data.png

- If necessary, change the options for job submission and select **OK**.
- The following dialog box will appear until a spot is open on the cluster for your job to run. When using the standby queue, this should be less than 60 seconds assuming the cluster is not completely busy.
- In **Plots** select **Pseudocolor** and **disp\_magnitude**.
- Select **Draw** and you should see an output similar to the following.

Figure 7.8: select\_options.png

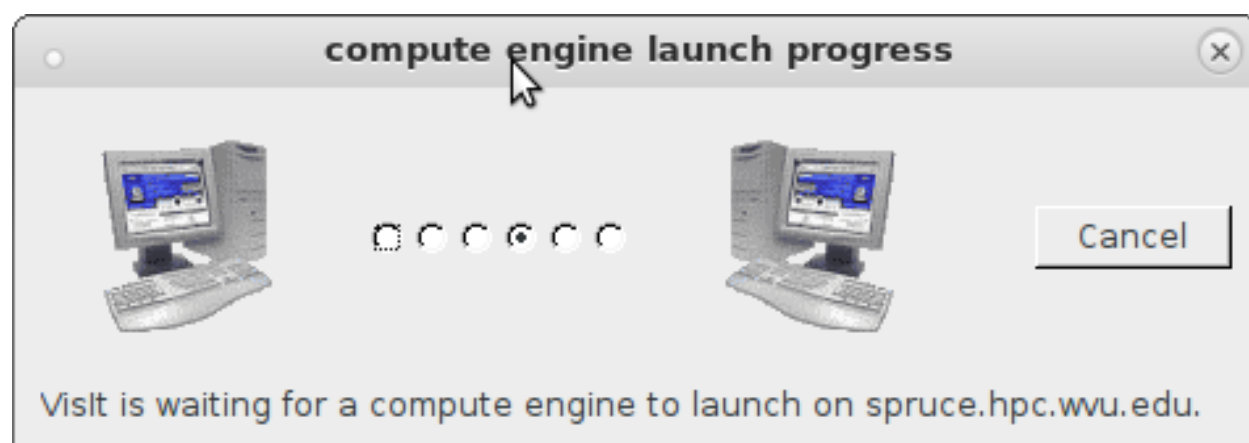

Figure 7.9: compute\_engine.png

Figure 7.10: visit\_output.png

## CLUSTERS SPECIFICATIONS

### 8.1 Mountaineer Cluster

#### 8.1.1 Hardware

#### 8.1.2 Queues

#### 8.1.3 Environment modules

### 8.2 Spruce Knob

#### 8.2.1 Hardware

#### 8.2.2 Queues

#### 8.2.3 Environment modules

The current state and limits of queues can be found using the qstat command.

There are three main queue types - research team queues, the standby queue, and community node queues.

## 8.2.4 Research Team Queues

Research teams that have bought their own compute nodes have private queues that link all their compute nodes together. Only users given permission from the research team's buyer (Usually the labs PI) will have permission to directly submit jobs to these queues. While these are private queues - unused resources/compute nodes from these queues will be available to the standby queue (see below). However, per the system-wide policies, all research team's compute nodes must be available to the research team's users within 4 hours of job submission. By default, these queues are regulated by first come, first serve queuing. However, individual research teams can ask for different settings for their respective queue, and should contact the RC HPC team with these requests.

## 8.2.5 Standby Queue

The standby queue is for using resources from research teams queues that are not currently being used. Priority on the standby queue is set by fair share queuing. This means that user priority is assigned based on a combination of the size of the job and how much system resources the user have used during the given week, with higher priority assigned to larger jobs and/or user jobs that have used fewer system resources in the week. Further, the standby queue has a 4 hour wall time.

## 8.2.6 Community Node Queues

Spruce Knob has several queues that start with the word 'comm'. These queues are linked to the 51 compute nodes bought using NSF funding sources, and as such is open for Statewide Academic use, hardware/resource information can be found on the Spruce Knob Systems page. These queues are separated by node type (i.e. large memory, gpu, smp) and can be used by all users. Currently, these nodes are regulated by fair share queuing. This means that user priority is assigned based on a combination of the size of the job and how much system resources the user have used during the given week, with higher priority assigned to larger jobs and/or user jobs that have used less system resources in the week. Further, all community queues have a 24 hour wall time, except for the week long medium memory queue (comm\_mmem\_week). comm\_mmem\_week allows jobs up to a week (168 hours); however, this queue class also limits the maximum number of nodes to 11, and a single user can not exceed 80 CPUs total within this queue. These

restrictions are set to prevent a single user occupying a large number of the community resources for an excessively long time.

## REFERENCES

### 9.1 Common Unix commands

The Research Computing HPC server's use Red Hat Enterprise Linux (RHEL) as the operating system. Many clusters around the world run exclusively Unix/Linux based operating systems. We strongly encourage users to actively get familiar with Unix command line interface and GNU/Linux in particular. Outstanding and Free documentation is provided at [<http://www.tldp.org> The Linux Documentation Project], specifically their [<http://www.tldp.org/guides.html> Guides] which cover basic topics including Using Linux and shell scripting to advanced File system and kernel modularization guides. Below is a succinct list of Unix commands that will help you get started in moving around and manipulating files.

#### 9.1.1 Moving around the file system

**pwd** List current directory

**ls** List contents of current directory

**ls -l** List contents of current directory with more information per file including permissions, last edited time, and size of file

**ls -lh** Same as **ls -lh** except file size is included in 'human readable' form (gigabytes, megabytes, kilobytes)

**ls -lt** Same as **ls -l**, except list files in chronological order with newer files occurring at the top

**cd dirname** Changes current directory to *dirname*

**cd ..** Changes current directory up one hierarchy level

#### 9.1.2 Examining Files

**cat <filename>** Concatenates *filename* and prints to standard output (screen)

**less <filename>** A filter that pages through *filename* one full screen at a time. Allows both forward and backward movement through file

**more <filename>** Similar to **less**, except cannot move backwards through file

#### 9.1.3 Manipulating Files and Directories

**cp <filename1> <filename2>** Copies *filename1* to *filename2*. If *filename2* is the name of a directory, copies *filename1* into the directory

**cp -i <filename1> <filename2>** Copies *filename1* to *filename2* and ask permission before overwriting

**cp -r <directory1> <directory2>** Copies *directory1* and all of it's contents to *directory2*

**mv <filename1> <filename2>** Renames "filename1" to "filename2". If "filename2" is a directory, moves "filename1" into directory

**mv -i <filename1> <filename2>** Renames "filename1" to "filename2" and ask permission before over-writing files

**rm <filename>** Removes file

**rm -i <filename>** Removes file and ask permission before doing so

**rm -r <directory>** Removes directory and it's contents

**rm -ir <directory>** Removes directory and it's contents asking permission for each file

**mkdir <directory>** Create a directory with "directory" as a name

**rmdir <directory>** Remove an empty directory

## 9.2 Linux Commands

The Research Computing HPC server's use Red Hat Enterprise Linux (RHEL) as the operating system. Many clusters around the world run exclusively Unix/Linux based operating systems. We strongly encourage users to actively get familiar with Unix command line interface and GNU/Linux in particular. Outstanding and Free documentation is provided at [The Linux Documentation Project](#), specifically their [Guides](#) which cover basic topics including Using Linux and shell scripting to advanced File system and kernel modulization guides. Below is a succinct list of Unix commands that will help you get started in moving around and manipulating files.

### 9.2.1 Moving around the file system

<b>pwd</b>	List current directory
<b>ls</b>	List contents of current directory
<b>ls -l</b>	List contents of current directory with more information per file including permissions, last edited time, and size of file
<b>ls -lh</b>	Same as ls -l except file size is included in 'human readable' form (gigabytes, megabytes, kilobytes)
<b>ls -lt</b>	Same as ls -l, except list files in chronological order with newer files occurring at the top
<b>cd</b>	Changes current directory to <i>dirname</i>
<b>*dirname*</b>	
<b>cd ..</b>	Changes current directory up one hierarchy level

### 9.2.2 Examining Files

<b>cat</b>	Concatenates <i>filename</i> and prints to standard output (screen)
<b>*filename*</b>	
<b>less</b>	A filter that pages through <i>filename</i> one screenful at a time. Allows both forward and backward movement through file
<b>*filename*</b>	
<b>more</b>	Similar to less, except cannot move backwards through file
<b>*filename*</b>	

### 9.2.3 Manipulating Files and Directories

<b>cp *filename1 filename2*</b>	Copies <i>filename1</i> to <i>filename2</i> . If <i>filename2</i> is the name of a directory, copies <i>filename1</i> into the directory
<b>cp -i *filename1 filename2*</b>	Copies <i>filename1</i> to <i>filename2</i> and ask permission before overwriting
<b>cp -r *directory1 directory2*</b>	Copies “ <i>directory1</i> and all of it’s contents to <i>directory2</i>
<b>mv *filename1 filename2*</b>	Renames <i>filename1</i> to <i>filename2</i> . If <i>filename2</i> is a directory, moves <i>filename1</i> into directory
<b>mv -i *filename1 filename2*</b>	Renames <i>filename1</i> to <i>filename2</i> and ask permission before overwriting files
<b>rm *filename*</b>	Removes file
<b>rm -i *filename*</b>	Removes file and ask permission before doing so
<b>rm -r *directory*</b>	Removes directory and it’s contents
<b>rm -ir *directory*</b>	Removes directory and it’s contents asking permission for each file
<b>mkdir *directory*</b>	Create a directory with <i>directory</i> as a name
<b>rmdir *directory*</b>	Remove an empty directory
